The imprecision of the Court's new standard creates potential ambiguity in many public employment decisions. The Court did not indicate the criteria to be used for determining which positions may remain under patronage, nor how a hiring authority could demonstrate the need for a requirement of party affiliation. Particu-

---

"Significant Decisions in Labor Cases" is written by Gregory J. Mounts of the *Monthly Labor Review* staff. Kate Farrell of the University of Notre Dame, an intern with the *Review,* wrote the summary of *Branti v. Finkel.*

larly noteworthy are the implications for the selection practices of government authorities. Quoting the opinion of the Second Circuit,[3] the Court stated "it is difficult to formulate any justification for tying either the selection or retention of an assistant public defender to his party affiliation." This line of reasoning suggests that considerations of party affiliation may be unconstitutional in the selection, as well as the retention, of certain government employees. Such a holding would raise interesting questions in the law enforcement field where, as Justice Lewis Powell noted in his dissenting opinion, party affiliation frequently plays an important role in the selection of prosecutors at all levels. Although the Court specifically excluded prosecutors from its *Branti* deliberations, Powell asserted that questions would arise as to how, under the Court's standard, a prosecutor's duties are any more related to "partisan" interests than those of an assistant public defender. Consequently, *Branti*, and any subsequent rulings that may arise from it, could have a significant impact on existing law enforcement machinery.

Powell's dissent, in which Justices William Rehnquist and Potter Stewart (in part) concurred, characterized the majority decision as an "exercise in judicial lawmaking" which brings under judicial scrutiny government hiring practices more properly left to legislative and executive discretion. Powell faulted the majority for its "broad, new standard" of determining the scope of patronage, implying it would lead to confusion and uncertainty. He also criticized the Court's interpretation of the First Amendment, claiming the constitutionality of patronage hirings and firings depends upon the governmental interests served by patronage. Equally, concluded Powell, the Court's decision denigrates the strength and accountability of the political parties and impairs the right of the local voters to structure their government.

Missouri compromised on sex standard

Missouri's workers' compensation law requires widowers seeking death benefits based on their wives' former earnings to prove that they were dependent on those earnings; widows seeking death benefits do not have to prove dependency. An 8-to-1 majority of the U.S. Supreme Court recently struck down this unequal treatment as unconstitutional sex discrimination, extending to State benefit laws the equal protection analysis used to void similar sex-based provisions for the distribution of Federal social security benefits. (*Wengler v. Druggists Mutual Ins. Co.*[4])

The earlier Supreme Court cases that foreshadowed the demise of the Missouri provision involved equal protection challenges to a pair of Social Security Act provisions. Both provisions assumed that men were the primary wage earners and their spouses, regardless of employment status, were dependent on them. As a result, survivors' benefits available to widows were either unavailable to similarly situated widowers[5] or conditioned on a showing of dependency.[6] In both cases, the Court ruled that the law deprived working women the protection for their families which men receive as a result of their employment, in violation of equal protection component of the Fifth Amendment. Justice John Paul Stevens wrote that such sex-based benefit provisions discriminate only against men who survive their employed wives. The Court acknowledged that both forms of discrimination resulted from the Missouri workers' compensation law.

The State had the burden of justifying the law's gender-based discrimination by showing that it served important governmental objectives and that the means employed were related to the achievement of those objectives. As the Federal Government had done under similar circumstances, the State failed. Missouri's claim of administrative convenience as justification for its 1925 legislative formula (presuming dependency for widows and not for widowers) was insufficient to meet the "heightened scrutiny" standard the Court applied under the equal protection clause of the Fourteenth Amendment to the Constitution. One factor influencing the Court's decision, wrote Justice Byron White for the majority, was that the State had failed to present any evidence as to what additional costs the State or Missouri employers may incur if men and women were treated equally under the law.

Despite its power to prescribe a remedy for the constitutional defect in the Missouri law, the Court left this task for the Missouri judiciary. The question of whether to extend the presumption of dependence to widowers or to eliminate it for widows (and investigate each claim) involves potentially great economic burdens for the State. White concluded "Because State legislation is at issue, and because a remedial outcome consonant with the State legislature's overall purpose is preferable, we believe that State judges are better positioned to choose an appropriate method of remedying the constitutional violation."

Title VII overrides class standards

In 1972, Congress amended Title VII of the 1964 Civil Rights Act to permit the Equal Employment Opportunity Commission to file civil suits on behalf of alleged victims of discrimination. Individuals who were represented by the commission retained their right to file private suits under certain circumstances. To represent a "class" of affected persons in such a private civil suit, certain Federal procedural requirements must be satisfied: the class must be sufficiently numerous and all members must share important interests. The procedural rule acts to limit the number of private class actions brought in Federal court. But did Congress intend for EEOC suits also to be constrained by such a rule? Two appeals courts split on this question, but the Supreme Court recently agreed with the Ninth Circuit that this rule does not apply to EEOC suits filed on behalf of a class. A 5-to-4 majority ruled that the 1972 amendments to Title VII plainly authorized such EEOC suits, making the application of standard procedural rules inappropriate. (*General Telephone Co.*[7])

EEOC brought suit against the General Telephone Co. of the Northwest, Inc. and International Brotherhood of Electrical Workers, Local 89 based on employee allegations that both had engaged in unlawful sex discrimination in the form of restrictions on maternity leave, access to craft jobs, and promotion to managerial positions. The agency sought injunctive relief and backpay for the women involved. The company, but not the union, sought to block EEOC's ability to sue on behalf of all allegedly affected women, claiming that the agency had not established a legitimate class action based on the requirements of Rule 23 of the Federal Rules of Civil Procedure. Despite the Fifth Circuit's contrary view, a Federal Magistrate, district court, and appeals court each reasoned that EEOC was not constrained by standard procedural restrictions on class actions.

General Telephone sought application of Rule 23 because one feature of that procedural provision is that a judgment in subsequent class action suits is binding upon all certified members of the class. This provision clearly prevents individual class members who may be unsatisfied with a judgment from seeking an additional award. No similar limitation exists for alleged discrimination victims under Title VII, and the company feared additional or supplemental claims.

Although it recognized that these are legitimate concerns, the Supreme Court refused to contradict what it found to be clear statutory expression providing EEOC the right to enforce Title VII. Writing for the Court, Justice Byron White found that the purpose of the 1972 amendments was to "implement the public interest" as well as to secure more effective enforcement of Title VII. EEOC's pre-1972 role was limited to "informal methods of conference, conciliation, and persuasion." According to White, EEOC's new authority was intended to supplement, not replace, private action. This suggests that EEOC's enforcement suits should not be considered representative actions subject to Rule 23, he wrote.

White went on to note the range of differences between Title VII's enforcement requirements and those permissible under Rule 23. The procedural rule imposes prerequisites of numerosity, commonality, typicality, and adequacy of representation. As pointed out by White, Title VII covers all employers and unions with at least 15 members; this would fall short of the number that has been required for class action suits in many cases.

Appeals courts have ruled that the EEOC is not limited to the charges brought by the workers represented in its suits; the typicality requirement of Rule 23, however, limits charges to those fairly encompassed by the named plaintiffs. Finally, Rule 23's adequate representation standard often prevents class certification when a conflict of interest occurs between the named plaintiff and the putative class. As White noted, a conflict between employees and applicants, as members of a single class, may easily occur over benefits or seniority in employment discrimination litigation.

Although permitting the EEOC to bring virtually unrestricted class actions in Federal courts, the Supreme Court issued some advice to the Federal judiciary in an attempt to overcome the equity concerns raised by General Telephone. White wrote that Federal courts should play an active role in deciding whether to permit workers covered by an EEOC suit (or award) to file private suits. Specifically, he wrote that courts should act to prevent an undue hardship for the defendant employer or union (for example, in the form of double recovery by an individual). Where EEOC has prevailed in its action, White advised, "the court may reasonably require any individual who claims under its judgment to relinquish his right to bring a separate private action." He also suggested that a similar requirement could be part of an EEOC-negotiated settlement (consent award). ☐

Major Agreements Expiring Next Month

This list of collective bargaining agreements expiring in September is based on contracts on file in the Bureau's Office of Wages and Industrial Relations. The list includes agreements covering 1,000 workers or more.

Employer and location	Industry	Union[1]	Number of workers
Anchor Hocking Corp. (Lancaster, Ohio)	Stone, clay, and glass products	Glass Workers	3,500
Appleton Electric Co. (Chicago, Ill.)	Electrical products	Electrical Workers (IBEW)	1,200
Atlantic Steel Co. (Atlanta, Ga.)	Primary metals	Steelworkers	1,100
Brockway Glass Co., Inc. (Clarksburg, West Va.)	Stone, clay, and glass products	Glass Workers	1,000
Champion International Corp., Champion Papers Division (Hamilton, Ohio)	Paper	Paperworkers	1,600
Clark Equipment Co. (Lima, Ohio)	Machinery	Auto Workers (Ind.)	1,300
Clothing Manufacturers Association of the United States of America (Interstate)	Apparel	Clothing and Textile Workers	80,000
Daitch Crystal Dairies, Inc. (New York, N.Y.)	Retail trade	Food and Commercial Workers	1,150
Delaval Turbine, Inc. (Trenton, N.J.)	Machinery	Steelworkers	1,200
Dresser Industries, Inc. (Orleans, N.Y.)	Machinery	Steelworkers	1,600
Envirodyne Co., Wisconsin Steel Division (Chicago, Ill.)	Primary metals	Progressive Steel Workers Union (Ind.)	3,350
Federal Paper Board Co. (Columbus, Ohio)	Stone, clay, and glass products	Glass Workers	1,500
Federal Paper Board Co. Inc. (Riegelwood, N.C.)	Paper	Paperworkers	1,200
Food Fair Stores, Inc. (Interstate)	Retail trade	Food and Commercial Workers	1,850
General American Transportation Corp. (Interstate)	Transportation equipment	Steelworkers	2,100
Giant Food, Inc. (Interstate)	Retail trade	Food and Commercial Workers	1,000
Great Atlantic and Pacific Tea Co., Inc., 2 Agreements (Interstate)	Retail trade	Food and Commercial Workers	3,050
Great Lakes Dredge & Dock Cos. (Interstate)[2]	Construction	Operating Engineers (IUOE)	2,200
Hercules, Inc. (Radford, Va.)	Chemicals	Oil, Chemical and Atomic Workers	1,700
Interco, Inc. (Arkansas)	Leather	Shoe Workers	3,950
Kohler Co. (Kohler, Wisc.)	Fabricated metal products	Auto Workers	3,600
Laclede Steel Co. (Alton, Ill.)	Primary metals	Steelworkers	2,500
League of New York Theatres, Inc. (Interstate)	Amusements	Actors	3,300
Lufkin Industries, Inc. (Lufkin, Tex.)	Machinery	Boilermakers; Machinists and Molders	1,700
Massachusetts Leather Manufacturers Association (Massachusetts)	Leather	Leather Workers	1,450
Mens Clothing Industry (California)[2]	Apparel	Clothing and Textile Workers	2,000
Milk Dealers (Interstate)[2]	Food products	Firemen and Oilers; and Teamsters (Ind.)	2,500
Montgomery Ward & Co., Inc., Catalog House (Chicago, Ill.)	Retail trade	Teamsters (Ind.)	1,100
National Steel Corp., Granite City Steel Division (Illinois)	Primary metals	Chemical Workers	1,000
New Orleans Steamship Association, 2 Agreements (Interstate)	Water transportation	Longshoremen's Association	7,000
National Industries, Inc., Doehler-Jarvis Division (Interstate)	Primary metals	Auto Workers (Ind.)	2,600
North Central Airlines, Clerical (Interstate)[3]	Air transportation	Air Line Pilots	1,700
New York Druggists Association (New Jersey and New York)	Retail trade	Food and Commercial Workers	2,500
Owens-Illinois, Inc. (Wisconsin)	Stone, clay, and glass products	Flint Glass Workers	1,150
Penn-Dixie Industries, Inc., Penn-Dixie Steel Corp. (Wisconsin)	Primary metals	Steelworkers	1,450
Retail Meat Cutters, 2 Agreements (Illinois)[2]	Retail trade	Food and Commercial Workers	5,400
Rheem Manufacturing Co. (Arkansas)	Transportation equipment	Steelworkers	1,600
Rockwell Internationl Corp. (Interstate)	Transportation equipment	Steelworkers	1,450
Savannah Maritime Association (Savannah, Ga.)	Water transportation	Longshoremen's Association	1,100

See footnotes at end of table.

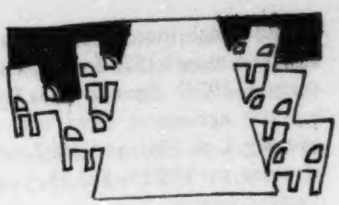
Erratum

The May issue of the *Monthly Labor Review*, page 33, contains the statement, "The CPI home-purchase index is compiled from data on home sales which involve mortgages insured by the Federal Housing Administration or the Veterans Administration." This statement is partially incorrect. House price data from FHA-insured mortgages are included in the CPI home-purchase index; however, comparable data from VA-guaranteed mortgages are not used for the CPI home-purchase index. The only data from VA-guaranteed mortgages used in the CPI are interest rate information, which is combined with comparable interest rates data from FHA-and conventionally insured mortgages in the computation of the mortgage interest cost component of the CPI.



Developments in Industrial Relations

Three aluminum companies settle

Contracts negotiated by the Steelworkers and the Aluminum Workers unions with three major aluminum companies were generally viewed as being more costly than the Steelworkers' April settlement with major basic steel producers. The aluminum settlements involved 30,000 employees of the Aluminum Company of America, Kaiser Aluminum and Chemical Co., and Reynolds Metals Co. and 19,000 Alcoa and Reynolds employees represented by the Aluminum Workers. Steelworkers' President Lloyd McBride said that the new aluminum contracts will narrow the gap between average hourly earnings in the two industries. McBride said that after the final pay adjustment in the aluminum contracts, which expire on May 31, 1983, pay rates will range from $12.73 to more than $16 an hour and average about $14.10. These estimates were based on the union's assumption that the Consumer Price Index, which triggers wage escalator adjustments for the workers, will rise at an annual rate of 11 percent.

The Council on Wage and Price Stability, which based its escalator calculations on the 7.5-percent CPI increase assumption specified in the administration's voluntary anti-inflation program, approved the aluminum accords. An official said the aluminum agreements provided for increases in compensation near the mid-point of the permitted 7.5- to 9.5-percent annual rate of increase.

The major differences between the settlements in the two industries centered on the wage escalator clause. In aluminum, workers received a 31-cent quarterly escalator adjustment on June 2, 1980, and, beginning with the third contract year, the formula will be revised to provide 1 cent an hour adjustments for each 0.26 point movement in the Consumer Price Index for Urban Wage Earners and Clerical Workers (1967=100). In steel, the Steelworkers gave up a 33-cent escalator adjustment scheduled for March 1980 to help defray the cost of pension improvements for current retirees and the union agreed to continue for the full contract term the 1 cent for 0.3 point formula that will also continue to apply during the first two years of the aluminum accords. (See *Monthly Labor Review*, June 1980, pp. 55–56 for terms of the steel settlement.) An unusual feature of the new escalator formula in aluminum is that the resulting increase in money will be paid in two forms—all of the increase that would have been generated by continuation of the 1 cent for each 0.3-point increase in CPI formula will be paid in the form of flat general increases to all employees and any additional amount will be used to increase the increment between job grades. The Steelworkers said that the purpose was to minimize the compression of pay rates that would otherwise occur if the entire amount of each escalator adjustment was paid in the form of a general increase.

The aluminum contracts provided for "set" general wage increases of 25 cents an hour on June 2, 1980, 20 cents on June 1, 1981, and 15 cents on June 7, 1982, matching those in steel. However, the increases in increments between job grades differed. The increment increases also differed among the aluminum companies, as part of a plan to attain near uniformity of pay rate structures among the three companies. The plan also provided for special pay adjustments for some employees of each companies to attain uniformity within that company.

The Steelworkers union, which had agreed to lesser settlement terms to avert the closing of some steel fabricating plants, also agreed to lesser terms for five "noncompetitive" aluminum plants. At these plants, employees will receive annual escalator adjustments, each limited to 35 cents an hour; a 10-cent general wage increase in each year (plus increment increases), and 50 percent of the improvements in pensions and sickness and accident benefits. All other terms match those for the other plants. The five are Alcoa's Richmond, Ind., plant and its Mantahola Power and Light Co. in Franklin, N.C.; Kaiser's Dolton, Ill., and Toledo, Ohio, plants; and Reynolds' Torrance, Calif., plant.

For present retirees, the pension rate was increased to $12.50 a month for each year of credited service for those who retired prior to June 1, 1971; to $13.25 for those who retired between June 1, 1971 and January 31, 1974; to $15.10–$19.50 (varying according to pre-retirement job grade) for those who retired between February 1, 1974 and May 31, 1977; and to $15.75–$20.25 for those who retired between June 1, 1977 and May 31, 1980. The new rates will be attained in two equal steps, with each increase not to exceed a total of $125 a

---

"Developments in Industrial Relations" is prepared by George Ruben and other members of the staff of the Division of Trends in Employee Compensation, Bureau of Labor Statistics, and is largely based on information from secondary sources.

month. Each increase is also subject to a minimum of $12.50 a month ($25 for those who retired prior to February 1, 1974). Pension rates for employees retiring during the agreement term will be increased by $2 on January 1 of 1981 and 1982, which will raise the range of rates to $18.25–$22.25 a month for each year of credited service.

Under a new paid personal leave plan, employees will receive six casual days off during the contract term. To partly offset the cost increase, United Nation's Day was dropped as a paid holiday in each year.

The maximum limit on Supplemental Unemployment Benefits for employees with less than 10 years service was increased by $25 a week in each year, bringing it to $260. There is no limit for longer-service employees. The maximum level of the fund was increased to 23 cents (from 18) per hour worked in the preceding 12 months and the employer's contribution rate was increased to 14.5 cents per hour worked until maximum funding is attained and to 5 cents until 125 percent of maximum funding is reached. Under the prior contracts, the rates were 12.5 and 2 cents.

Other improvements included $25,000 life insurance coverage (formerly $10,000); $235 to $303 a week sickness and accident benefits (formerly $168 to $230); 365 days convalescent nursing home coverage; 100 visits a year by nurses and technicians, plus coverage of appliances and supplies, for persons confined to their own homes; $100,000 major medical coverage (formerly $50,000); and increased vision and dental care benefits.

In the noneconomic area, the parties agreed to establish a joint committee to develop methods for solving local problems of mutual concern, mentioning the formation of plant level bodies as a possible approach.

Bargaining was continuing with other aluminum companies for 14,000 workers represented by the unions.

Lumber workers' contract sets industry pattern

More than 35,000 loggers, sawmill, and plywood plant workers in the Pacific Northwest were covered by a settlement between 10 major forest products companies and the Woodworkers union and the Lumber, Production and Industrial Workers union, a division of the Carpenters union. The companies compose the Western States Wood Products Employers Association, which was formed prior to the start of the talks; previously, negotiations with the unions were conducted on a company-by-company basis. The 3-year accord was expected to set a pattern for 30,000 employees of member companies of the Timber Operators Council (another large employer association) and hundreds of independent companies.

Settlement terms included an 80-cent-an-hour wage increase on June 1, 1980, 75 cents on June 1, 1981, and 70 cents on June 1, 1982. Employees paid on a piecework basis receive equivalent increases. (According to a union official, pay averaged between $8.30 and $8.50 an hour under the prior contracts.) A pool equal to $491.70 an hour was established for special pay adjustments to skilled workers, with the allocation of the money to be determined by a union-management committee. Shift differentials were increased by a total of 9 cents an hour over the term and the "woods travel time" differential was increased by 10 cents per qualifying hour.

Other provisions included an additional paid holiday, beginning June 1, 1982; a 20-cent-an-hour increase in the employer payment to the health and welfare fund over the term; and a $2.50 increase in the normal pension rate, bringing it to $19.50 a month for each year of credited service. Employees affected by a permanent plant shutdown who are eligible for early retirement (10 years of service and age 55) were given the option of deferring the benefit payments until age 62 and avoiding the actuarial reduction that would otherwise apply. At the time of the settlement, about 20,000 forest products workers were unemployed in the region because of production cutbacks attributed to a reduction in building construction.

The companies that settled for operations in Alaska, Washington, Oregon, California, Idaho, and Montana are Boise-Cascade Corp., Champion International Co., Crown Zellerbach Corp., Georgia Pacific Corp., ITT Rayonier Inc., International Paper Co., Louisiana Pacific Corp., Publishers Paper Co., Simpson Timber Co., and Weyerhaeuser Co.

Furniture workers settle, end strike

The United Furniture Workers settled with the Memphis (Tenn.) Furniture Manufacturing Co. on a 2-year contract that ended a 10-week strike and was expected to set a pattern for two furniture manufacturers the union had recently organized in the area. Three other newly-organized companies had already settled. Union president Carl Scarbrough said that the Memphis Furniture agreement provided for the retention of existing insurance and union security provision and the extension of the grievance procedure to cover piecework disputes, which he described as victories for his organization.

Hourly wages, which reportedly averaged $3.50 to $4 prior to the settlement, will be increased by 45 cents for skilled workers and 40 cents for other workers in two steps during each year of the contract. Other provisions for the 1,200 workers included a 10th annual paid holiday beginning in the second year; a Christmas bonus; additional holiday and vacation pay for incentive workers; paid funeral leave; and time and one-half pay after

8 hours a day, rather than 40 hours a week.

Flight attendants get double time for holiday work

A 2-year agreement for 9,000 flight attendants was signed by United Airlines and the Association of Flight Attendants. It provided for general wage increases of 13 percent on April 2, 1980 (employees with at least 14 years of service will get an additional 1.7 percent), and 10 percent a year later. The escalator clause provided for cost-of-living adjustments in October of 1980 and 1981 of 30 cents a month for each 0.3-point rise in the BLS-CPI-W (1967=100) with a maximum of $15 a month for each adjustment.

As before, employees will not be paid for holidays not worked, but for the first time, they will be paid double time for working on any of the 10 designated holidays. Vacations were liberalized by providing 30 days of time off after 11 years of service (formerly 12 years) and after 10 years beginning in the second contract year and by providing 37 days after 19 years of service (formerly 20 years) and after 17 years starting in the second year. Senior pay and buffet pay were increased to $2 to $2.50 (from $1.75 to $2.25) and $1 to $1.25 (from 75 cents to $1), depending on the type of aircraft. The major medical expense maximum was increased to $400,000 (from $250,000) and life insurance was doubled to $200,000. Employees' past contributions to the pension fund were refunded, and the normal retirement age was raised to age 65, from age 60.

Insurance Workers, Steelworkers end merger talks

The Insurance Workers ended a year of merger negotiations with the Steelworkers when the union's General Executive Board ruled that the two unions could not reach agreement on a dues structure. The Steelworkers had insisted that the Insurance Workers approach be similar to theirs, which calls for members to pay monthly dues equal to two hours' pay. Insurance Workers President Joseph Pollack said that his unions' members, who currently pay a flat $9.50 a month, would not accept that approach because they are paid on a commission basis and their earnings vary considerably from year to year. Both unions offered compromise proposals, without success.

After the amicable termination of talks, Pollack said that his 20,000-member organization would continue to seek a merger but to assure "maximum organizing and bargaining strength," any proposed partner must have at least a million members.

Panels on economic policy established

The Carter Administration and the AFL-CIO agreed to set up two joint panels on economic policy, one to draw up short-range antirecession plans and the other to suggest a long-range plan for the "re-industrialization" of America.

The meetings that led to the agreement were conducted in compliance with the September 1979 "national accord" between the Administration and organized labor.

The new antirecession panel was expected to prepare specific proposals for alleviating conditions for the unemployed, the poor, the elderly, and others particularly hard hit by the current economic slowdown. In the past few months, AFL-CIO President Lane Kirkland had become increasingly critical of Administration efforts in this area, contending that the poor and the needy were bearing the brunt of anti-inflation measures in violation of the principles of the national accord.

The other panel will examine and suggest remedies for long-term problems in certain industries, such as import competition and obsolete plants and equipment. An Administration official said that eventually industry officials and representatives of unions outside the AFL-CIO will be added to this panel.

Three studies on pensions

A number of recent developments reflects the Nation's concern over the adequacy of workers retirement income. At the Federal Government level, a presidential panel on pensions issued an interim report suggesting that private employers be required to provide a minimum level of protection for their retirees and the Department of Labor proposed a change in its regulations concerning the types of ventures in which plan trustees are permitted to invest. Elsewhere, the AFL-CIO issued a report encouraging unions to press for a larger role in deciding how plan assets should be invested.

The 10-member President's Commission on Pension Policy noted in its report that some companies have voluntarily increased pensions for their retirees to at least partly offset the rise in living costs. While agreeing that such adjustments should be "encouraged," the commission stopped short of recommending that they be mandated, saying that "the greatest emphasis should be placed on expanding pension coverage rather than providing full inflation protection to some (retirees) at this time."

The commission suggested that the definition of retirement may need to be changed. It affirmed the right of every American to normal retirement at a stipulated age, but encouraged work opportunities for older workers. Explaining that people should expect retirement to constitute a constant proportion of their adult lives, the commission suggested that the normal retirement age be raised at some time in the future for people born after 1945.

The final report, expected in February 1981, may differ from the interim findings because of questions raised by some of the commission's members and the outcome of staff studies on certain issues. Members from organized labor, business, banking, State legislatures, and academia were represented on the commission.

In its study, the Department of Labor estimated that the value of private pension plans in the United States will reach $3,000 billion in 1995, compared with $211 billion in 1975 and more than $300 billion in 1980. Much of this growth will result from inflation—in terms of constant 1975 dollars, the value of pension assets will total only about $900 billion in 1995. Nevertheless, the growth will have "an incredible impact" on investment markets, increasing the already complex problems of regulating pension funds, according to Ian D. Lanoff, administrator of pension and welfare benefit programs. Therefore, new decisions will have to be made on who will control the funds and how best to use them, including consideration of the social usefulness of pension investments.

The proposed new regulation announced by the Labor Department will make it easier for private employee-benefit plans to invest in venture-capital firms, which are usually partnerships that invest in fledgling companies, giving them financial help and management advice. The new regulation will become official after a 60-day period, subject to possible changes based on comments the Department receives from interested parties.

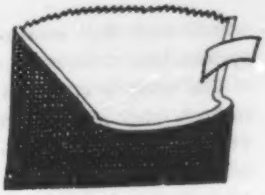
Last year, the Labor Department had proposed to treat benefit plan investments in venture capital firms as "plan assets," which would have meant that trustees would be liable for the venture capital firms' activities, including their unprofitable investments. This drew critical responses from venture capital firms, which claimed that the regulation would dry up their chief source of capital. The new regulation will treat investments in venture-capital firms in the same manner as investments in ordinary operating companies. However, venture-capital firms will still have to meet some special requirements—they will only be permitted to invest in companies in which they have a management role and they will have to provide pension fund trustees with annual audited financial statements.

In its benefit plan study, the AFL–CIO's Industrial Union Department found that workers' pension funds are sometimes being used to create overseas jobs and to finance nonunion companies. Jacob Sheinkman, secretary-treasurer of the Clothing and Textile Workers and head of the seven-member study committee, said, "Labor loses twice from current pension fund management. In the short run, benefits may be threatened by inadequate rate of return and in the long run, our own money works to take away our jobs and diminish our overall economic well being."

According to project director Richard Prosten, the average pension fund had a 4.3-percent a year rate of return over the last 10 years, compared with 5.9 percent for Standard and Poor's index of 500 stocks and, "in many instances, participants would have been better off if their funds had been invested in passbook savings accounts, rather than in equity stock."

The committee urged unions to seek joint administration of benefit funds through the collective bargaining process or through a commitment from the employer that the union may participate in important decisions affecting the funding, including selection of trustees and investment managers. If these efforts prove unsuccessful, the final step would be to press for legislation guaranteeing workers a voice in fund operations.

The report was based on an examination of the investment practices of 10 "representative large industrial companies" and 192 collectively bargained or public sector benefit plans. The committee obtained 545 plans and analyzed 35 investment portfolios. ☐



Book Reviews

Divergent views on bargaining

Collective Bargaining: New Dimensions in Labor Relations. Edited by Franklin J. Havelick. Boulder, Colo., Westview Press, 1979. 183 pp. $20.

Long ago, I read an article describing personality types which create problems in collective bargaining. Now we have a book, edited by Franklin J. Havelick, in which are collected the views of labor relations leaders who help rather than hinder the resolution of labor problems by collective bargaining innovations.

The book stems from 2 years of discussions at the Institute of Collective Bargaining and Group Relations of New York City, a program supported by the Ford Foundation and sponsored by the New York State School of Industrial and Labor Relations, Cornell University. It is divided into 10 chapters with the authors of each chapter discussing collective bargaining as it is related to particular issues: economics, politics, international trade, productivity, inflation, employment policy, and the quality of working life.

Havelick's thesis is that social, political, and economic pressures affect the collective bargaining process resulting in a new and constantly changing system of collective bargaining. The book is an examination of this system, one whose working varies with the different experts depending on their experiences and their positions in the labor-management community.

Havelick presents the views of Wayne L. Horvitz (Federal Mediation and Conciliation Service) contrasted with the views of William W. Winpisinger (International Association of Machinists); Theodore W. Kheel (Institute of Collective Bargaining) and Glenn E. Watts (Communication Workers of America); Benjamin F. Bailar (former U.S. Postmaster General) and Albert Shanker (American Federation of Teachers); Sol C. Chaikin (International Ladies' Garment Workers' Union) and Malcolm L. Denise (former vice president for Labor Relations, Ford Motor Co.); and Ernest G. Green (Assistant U.S. Secretary of Labor) and Jerome M. Rosow (Work in America Institute). In these discussions, the authors explain how collective bargaining is helping solve the problems they face and what they expect of it in the future.

These experts are paired to provide contrasting views on particular issues. For example, Chaikin and Denise tell how circumstances have shaped their ideas about collective bargaining. Each sees it differently, of course, since one represents employees of thousands of small labor-intensive employers who compete with employers of cheap labor in Mexico, Hong Kong, Taiwan, South Korea, and Thailand. The other speaks for a major firm which operates plants in countries throughout the world as well as in the United States.

It is instructive, for example, to see how sharply divergent labor leaders can be in their attitudes toward the role of the Federal Government regarding inflation. According to Watts:

> If the government is to play a constructive economic role, it must pursue a demonstrably sound Keynesian program of tax reductions, economic subsidies, and deficit spending to achieve economic growth. . . . Labor will also seek public benefits that substitute for wage increases and can have significant anti-inflationary effects. . . . A growing emphasis on political remedies to economic problems is one of the larger, long-term effects of inflation on labor relations.

He also proposes increased Federal expenditures on housing and health care.

Shanker, however, notes that, although teachers will be encouraged to "assert themselves politically," they "are increasingly conscious that collective bargaining gains can be lost by national politics that effect aid to education and other aid to the States, by inflationary policies that cheapen wage increases, and by health policies that limit disposable income."

Those who find new insights in this book may want to read *Work in America: The Decade Ahead*, edited by Clark Kerr and Jerome M. Rosow (1979). It has other prominent labor relations leaders look at similar issues in an approach somewhat broader in scope. However, neither of these books deals with collective bargaining techniques as does Reed C. Richardson in his excellent *Collective Bargaining by Objectives: A Positive Approach* (1977).

Readers will ask themselves how the experts assembled by Havelick can differ so radically on how they are affected by inflation, foreign competition, and other issues. Havelick supplies the answers by having them describe their problems, experiences, and collective bargaining solutions. This should give pause to those who urge ready-made, definite, unambiguous solutions to work problems without considering those factors which call for a variety of experimental, creative approaches.

The book is clearly written and should prove useful to both labor relations students and policymakers in the world of work.

Perils of overseas investment

Foreign Investment and the Management of Political Risk. By Dan Haendel. Boulder, Colo., Westview Press, 1979. 206 pp. $18.50.

In the conduct of international business, one must expect to encounter a political milieu very different from one's domestic political environment. In the best of circumstances, this fact can cause the international investor some uncertainty, and in the extremely unstable political conditions that prevail in some regions, the risk of sustaining substantial loss on an investment as a result of political change can be significant. Dan Haendel has approached this important and very complex issue in this admittedly "modest attempt to contribute to the formulation of better corporate and public policy." Unfortunately, he is only modestly successful in achieving this limited goal.

A major factor in the failure of *Foreign Investment and the Management of Political Risk* to develop its full potential is the author's apparent indecision as to who his audience should be. From the academics' viewpoint, this work could only be regarded as a somewhat overlong survey of literature, with scant original material, interpretation, or analytic synthesis. If Haendel was attempting to reach the technical specialist in country risk analysis, he has provided no depth of technical detail in his summaries of method, even though he does cover a fairly wide range of earlier work of his own and of other authors. If he intended an audience of upper-level executives, private or public, his book does not provide a really effective guide to a decisionmaker's interpretation of technical analyses of political risk. It did not seem that the author was actually unaware of these concerns, he simply did not focus his attention on any one of them and, as a result, did not adequately address anyone's needs.

On a more specific level, I would like to take issue with Haendel's "Political System Stability Index" (PSSI). The PSSI is an extension of earlier work by Haendel and two coauthors, and is one of the few places where the reviewer can directly criticize a substantive contribution of the author's. When reduced to the shorthand of mathematical notation, the PSSI takes the form:

$$PS_j = \sum_{1}^{n} a_i Z_{ij}$$

where PS_j is the PSSI value for country j, Z_{ij} is the Z-score $((X_{ij} - \overline{X}_i)/s_i)$ of the ith indicator for country j, and a_i is the weight assigned to the ith indicator.

Despite the author's insistence that this index is based on "hard" quantitative data rather than "soft" measures of opinion, it is obvious that the index is quite dependent on the weighting structure; and the weighting structure in this case has been arbitrarily and somewhat carelessly imposed using extremely tenuous theoretical justifications. For instance, energy consumption per capita, which is assumed to be a proxy for economic development, which is itself assumed to have a positive relationship with political stability, is given 5 times the weight of such direct measures of political unrest as riots and government crises, and over 3 times the weight of such indicators as assassinations and coups d'état. As justification for a conclusion of this counterintuitive, the reader might reasonably expect more than the skimpy theoretical framework and nearly nonexistent empirical validations presented in this volume.

Even with its flaws, this volume contains the seeds of a good deal of future work. The importance of such a research program in this field is underscored by a *Wall Street Journal* (Feb. 20, 1980, p. 25) quotation of the executive vice president of the Chase Manhattan Bank saying that, as a whole, the banking industry has been doing a "pretty miserable job of predicting political risk." In a similar vein, Edward Frydl, writing in the Federal Reserve Bank of New York's *Quarterly Review* (Winter 1979–80, pp. 11–20), has identified miscalculation of political risk as one potential destabilizer of the Eurocurrency markets, and, through those markets, the international monetary system. If Haendel chooses to write off this book as a preliminary exercise, he should be expected to contribute much more to this vital field.

Growth industry for neutrals

Government Labor Relations: Trends and Information for the Future, Vol. I, 1975–1978. Edited by Hugh D. Jascourt. Oak Park, Ill., Moore Publishing Co., Inc., 1979. 399 pp. $12.

In recent years, interested persons have raised questions concerning the future of collective bargaining in the United States. Some have asked: "Is collective bargaining dead?" They point to figures published by the Bureau of Labor Statistics which clearly indicate that overall labor-union growth has declined in the private sector, and that union membership as a proportion of labor force and/or nonagricultural employment has dropped significantly over the years.

The only major area where growth in union membership has occurred is in the public sector—Federal, State, and local governments. In fact, growth in these areas is the reason that organized labor has been able to maintain a steady rate in overall membership. It is useful to keep in mind that approximately 1 of 6 U.S. workers is employed by government, with about 1 of 5 public workers employed by State and local governments.

Many writers point to President Kennedy's Executive Order 10988, issued in 1962, as the stimulus for public-sector unionism. While several States and cities had already ventured into collective bargaining with representatives of their employees, Executive Order 10988 served to generate increased union activity in the Federal Government and among the States and communities.

What has emerged is a hodge-podge of laws, regulations, administrative procedures, and attitudes which have given public-sector unionism an aura of instability, experimentation, volatility, and immaturity.

Many books and articles have been written about specific laws, illegal job actions, administrative deficiencies, and so forth, in the public sector. There are also dozens of courses and seminars held each year for practitioners, administrators, neutrals, or anyone else interested in public-sector unionism. The problem is often one of what to read or which seminars or conferences to attend. In fact, however, it is difficult to find in one place, one book, or one meeting, enough about the field as a whole to serve the needs of those involved in public-sector labor relations.

This book provides a blend of legal, conceptual, and operational material that offers the reader a solid foundation concerning the history and current state of the art in public-sector labor relations. It is organized into three parts, as follows:

Part I provides an evolutionary picture of State and local level labor relations by setting out briefly the major issues and legal decisions that have shaped the collective bargaining systems. It discusses questions of coverage, unit determination, recognition, elections, union security, scope of bargaining, grievance procedures, other dispute resolution procedures, impasse resolution, problems of strikes, and other important areas that have made public-sector collective bargaining so dynamic and complicated.

Part II provides coverage of some of the more significant legal decisions in the public-sector area, such as the National League of Cities v. Usery constitutional issue. Other landmark cases pertaining to authority of courts, units, arbitration, fiscal crises, strikes and strikers, union security, duty of fair representation, and so forth, provide a well-rounded legal framework for the reader.

Part III is a series of articles by individuals knowledgeable about public-sector labor-management relations. It covers various viewpoints and perspectives, such as political, economic, labor, management, and the public.

One article, "Training Programs for Neutrals" is long overdue. This reviewer has often been asked by students to suggest ways to become a neutral in the field of collective bargaining. The article describes a variety of training programs that have been tried or which are still underway. It is hard to know, however, which programs are really open to all interested parties and which have provided bona fide opportunities, particularly for young people interested in the field. Experience has shown that parties to a dispute want knowledgeable, experienced neutrals handling their cases. Young people need to get experience, but how does one get this experience? Internships and working with known, competent neutrals are suggested ways. Much more needs to be written about this area.

This is a book well worth acquiring as a ready reference source, or as auxiliary text for a course in public-sector collective bargaining.

Managers as entrepreneurs

Managing Change: Today's Challenge to Management. By John E. Flaherty. New York, Nellen Publishing Co., 1979. 171 pp., bibliography. $9.95.

This book, by John E. Flaherty, encompasses subject matter that is broader than either its title or chapter titles would lead one to suspect. Five of the six chapter headings include the word entrepreneur. The book discusses private sector management and entrepreneur as used here means the preferred qualities of any manager. Hence, the book is broad-based; it is unblushingly a Peter Drucker-style book. Indeed, Flaherty gives Drucker credit for being both his inspiration and a source of encouragement.

The strength of this volume is its freshness of perspective, the author's ability to embrace a vast amount of managerial data (financial, anecdotal, and so forth), and to use it Drucker-like to illustrate a point. Although Flaherty has a broad knowledge of successful and unsuccessful corporate managerial and marketing strategies, he does not come up to the richness, the vision, and the readability of a Drucker.

Some sections of the book are insightful and exciting, other sections seem trivial, and in some instances are highly questionable. Because such a broad range of facts, tactics, firms, and stories are covered, it is not surprising that the book is uneven. It would take a superman to master this material; in fact, Flaherty has not done badly. Perhaps he deserves credit for even trying.

The first half of the book is a loosely-knit collection of suggestions, examples, and broad analyses. The author urges the firm to be opportunity-oriented rather than problem-focused; it should be ready to drop a failing product. Although Flaherty urges abandonment of an obsolete product or plant, he urges caution in one area: ". . . products should be treated ruthlessly; but, with people, loyalty and conscience should be factored into the decision."

Flaherty shows how the firm can be more efficient by concentrating on its "knowledge excellence," and not trying to produce and market a broad range of unrelated products. He cites firms such as Sears, Roebuck and Co., Pepsi Cola, Music Corp. of America, K-Mart, and Anheuser-Busch, which did so successfully, and W. T. Grant, which failed in this.

The latter half of the book is broader in scope. The author presents an excellent list of questions for managing capital resources, a strong criticism of the theories of contemporary managerial psychologists, useful hints for the manager on the use of time, and good suggestions on making performance appraisal more positive.

Flaherty correctly describes new business as flexible, willing to assume risks, and innovative. He also notes that a majority of the larger firms are unwilling to take risks, and, therefore, are not creative.

Flaherty's background in management was obtained through consulting and teaching; his lack of education in business disciplines is demonstrated in his treatment of various items. For example, the book is about entrepreneurship among managers. The basic motive of entrepreneurs is achievement. Flaherty evaluates many psychologists who treat motivation, but fails to include David McClelland, who has done so much on the need to achieve.

Flaherty calls the idea of profit "deceptively easy . . . In an engineering and physical science sense it is the ratio between inputs on efforts and outputs or results . . . " This reviewer has never heard profit described as a ratio and does not understand it. Flaherty fails to provide any additional explanation. Because Flaherty is a historian, one would have hoped to enjoy more historical and humanistic examples beyond the occasional reference to Pascal or St. Augustine.

It is distracting that Flaherty consistently notes the university affiliation of Harvard academics, and not others. The editor and publisher should have caught the serious mix-up of text on pp. 99–100.

There is some excellent material in this book. Although it is uneven, it deserves our attention.

Covering the safety and health spectrum

Protecting People at Work: A Reader in Occupational Safety and Health. Edited by Judson MacLaury. Washington, U.S. Department of Labor, 1980. 361 pp. Stock No. 029-015-00055-4. $6.50, paper, Superintendent of Documents, Washington 20402.

The Occupational Safety and Health Act requires an annual report to Congress on the status of worker on-the-job safety and health. It is part of the law frequently ignored, and always postponed. Now comes an official U.S. Labor Department book—honoring Frances Perkins—which makes up for those lapses.

The numerous authors of this book, edited by Judson MacLaury, include many of the new breed of environmental specialists who have come to the forefront during the Ray Marshall and Eula Bingham era at the U.S. Occupational Safety and Health Administration.

Their viewpoints and plain talk make for smooth and informative reading. For too long a time, occupational safety and health literature has been burdened with a remoteness which has driven the trade away. This book was meant to be read, not stacked away for reference. Workers who read this book and heed the information presented could possibly live longer and fuller lives.

Government publications often run a long timespan between the author's typewriter and final print. There are gaps in the book which suffer from time problems. For example, the excellent new series of Occupational Safety and Health booklets would have made a useful appendix (at least a few gutsy excerpts are worth adding). And, Bingham's columns, which scored so well in many labor papers, ought to have found a place in this book.

A reading list of some of the best news articles and books which have proliferated in recent years—and were a feature of OSHA's media seminar in Chicago in 1979—would have been a welcome addition.

Still, it is hard for me to quarrel with the actual contents. The book has a good range of material and the writers know their subject matter. They write felicitously and are not long-winded.

There is hardly a nook in the nearly endless topic of health and safety which is not treated—chemicals, noise, dust, reproductive hazards, and the human body. Each is given a good introduction. And there is more—

the regulatory controversy, OSHA and its mission, comparative foreign experiences, and the economics of health and safety. Plenty to ponder here.

Yet, the Nation today is full of eager OSHA students —workers, unions, organizations, trade associations, members of Congress, think-tanks on all sides of the spectrum—who hunger for more information on the often baffling OSHA universe. If there is any flaw in this welcome book, and it is very minor, it is that readers who search for reference sources may not always know where to look. May this, then, be the first of a new series of updates as the OSHA mission is increasingly fulfilled.

30. Producer Price Indexes for the output of selected SIC industries 92

Productivity data. Definitions and notes 95
31. Annual indexes of productivity, hourly compensation, unit costs, and prices, 1950–79 95
32. Annual changes in productivity, hourly compensation, unit costs, and prices, 1969–79 96
33. Quarterly indexes of productivity, hourly compensation, unit costs, and prices, seasonally adjusted 96
34. Percent change from preceding quarter and year in productivity, hourly compensation, unit costs, and prices 97

Labor-management data. Definitions and notes 98
35. Wage and benefit settlements in major collective bargaining units, 1975 to date 98
36. Effective wage rate adjustments going into effect in major collective bargaining units, 1975 to date 98
37. Work stoppages, 1947 to date 99

NOTES ON CURRENT LABOR STATISTICS

This section of the *Review* presents the principal statistical series collected and calculated by the Bureau of Labor Statistics. A brief introduction to each group of tables provides definitions, notes on the data, sources, and other material usually found in footnotes.

Readers who need additional information are invited to consult the BLS regional offices listed on the inside front cover of this issue of the *Review*. Some general notes applicable to several series are given below.

Seasonal adjustment. Certain monthly and quarterly data are adjusted to eliminate the effect of such factors as climatic conditions, industry production schedules, opening and closing of schools, holiday buying periods, and vacation practices, which might otherwise mask short-term movements of the statistical series. Tables containing these data are identified as "seasonally adjusted." Seasonal effects are estimated on the basis of past experience. When new seasonal factors are computed each year, revisions may affect seasonally adjusted data for several preceding years. For a technical discussion of the method used to make seasonal adjustments, see "Appendix A. The BLS Seasonal Factor Method," *BLS Handbook of Methods for Surveys and Studies*, Bulletin 1910 (Bureau of Labor Statistics, 1976), pp. 272–78, and *X-11 Variant of the Census Method II Seasonal Adjustment Program*, Technical Paper No. 15 (Bureau of the Census, 1967). Seasonally adjusted labor force data in tables 2–7 were last revised in the February 1980 issue of the *Review* to reflect the preceding year's experience. Beginning in January 1980, the BLS introduced two major modifications in the seasonal adjustment methodology for labor force data. First, the data are being seasonally adjusted with a new procedure called X-11/ARIMA, which was developed at Statistics Canada as an extension of the standard X-11 method. A detailed description of the procedure appears in *The X-11 ARIMA Seasonal Adjustment Method* by Estela Bee Dagum (Statistics Canada Catalogue No. 12-564E, September 1979).

The second change is that seasonal factors are now being calculated for use during the first 6 months of the year, rather than for the entire year, and then are calculated at mid-year for the July-December period. Revisions of historical data continue to be made only at the end of each calendar year. Annual revision of the seasonally adjusted payroll data in tables 11, 13, 16, and 18 begins with the August 1980 issue using the X-11 ARIMA seasonal adjustment methodology. New seasonal factors for productivity data in tables 33 and 34 are usually introduced in the September issue. Seasonally adjusted indexes and percent changes from month to month and from quarter to quarter are published for numerous Consumer and Producer Price Index series. However, seasonally adjusted indexes are not published for the U.S. average All Items CPI. Only seasonally adjusted percent changes are available for this series.

Adjustments for price changes. Some data are adjusted to eliminate the effect of changes in price. These adjustments are made by dividing current dollar values by the Consumer Price Index or the appropriate component of the index, then multiplying by 100. For example, given a current hourly wage rate of $3 and a current price index number of 150, where 1967 = 100, the hourly rate expressed in 1967 dollars is $2 ($3/150 × 100 = $2). The resulting values are described as "real," "constant," or "1967" dollars.

Availability of information. Data that supplement the tables in this section are published by the Bureau of Labor Statistics in a variety of sources. Press releases provide the latest statistical information published by the Bureau; the major recurring releases are published according to the schedule given below. The *Handbook of Labor Statistics 1978*, Bulletin 2000, provides more detailed data and greater historical coverage for most of the statistical series presented in the *Monthly Labor Review*. More information from the household and establishment surveys is provided in *Employment and Earnings*, a monthly publication of the Bureau, and in two comprehensive data books issued annually—*Employment and Earnings, United States* and *Employment and Earnings, States and Areas*. More detailed information on wages and other aspects of collective bargaining appears in the monthly periodical, *Current Wage Developments*. More detailed price information is published each month in the periodicals, the *CPI Detailed Report* and *Producer Prices and Price Indexes*.

Symbols

p = preliminary. To improve the timeliness of some series, preliminary figures are issued based on representative but incomplete returns.
r = revised. Generally this revision reflects the availability of later data but may also reflect other adjustments.
n.e.c. = not elsewhere classified.

Schedule of release dates for major BLS statistical series

Title and frequency (monthly except where indicated)	Release date	Period covered	Release date	Period covered	MLR table number
Employment situation	August 1	July	September 5	August	1–11
Producer Price Index	August 15	July	September 5	August	26–30
Consumer Price Index	August 22	July	September 23	August	22–25
Real earnings	August 22	July	September 23	August	14–20
Productivity and costs (quarterly):					
Nonfinancial corporations	August 27	2nd quarter	....	....	31–34
Work stoppages	August 28	July	September 29	August	37
Labor turnover in manufacturing	August 29	July	September 30	August	12–13

EMPLOYMENT DATA FROM THE HOUSEHOLD SURVEY

EMPLOYMENT DATA in this section are obtained from the Current Population Survey, a program of personal interviews conducted monthly by the Bureau of the Census for the Bureau of Labor Statistics. The sample consists of about 65,000 households beginning in January 1980, selected to represent the U.S. population 16 years of age and older. Households are interviewed on a rotating basis, so that three-fourths of the sample is the same for any 2 consecutive months.

Definitions

Employed persons are (1) those who worked for pay any time during the week which includes the 12th day of the month or who worked unpaid for 15 hours or more in a family-operated enterprise and (2) those who were temporarily absent from their regular jobs because of illness, vacation, industrial dispute, or similar reasons. A person working at more than one job is counted only in the job at which he or she worked the greatest number of hours.

Unemployed persons are those who did not work during the survey week, but were available for work except for temporary illness and had looked for jobs within the preceding 4 weeks. Persons who did not look for work because they were on layoff or waiting to start new jobs within the next 30 days are also counted among the unemployed. The **unemployment rate** represents the number unemployed as a percent of the civilian labor force.

The **civilian labor force** consists of all employed or unemployed persons in the civilian noninstitutional population; the **total labor force** includes military personnel. Persons **not in the labor force** are those not classified as employed or unemployed; this group includes persons retired, those engaged in their own housework, those not working while attending school, those unable to work because of longterm illness, those discouraged from seeking work because of personal or job market factors, and those who are voluntarily idle. The **noninstitutional population** comprises all persons 16 years of age and older who are not inmates of penal or mental institutions, sanitariums, or homes for the aged, infirm, or needy.

Full-time workers are those employed at least 35 hours a week; **part-time workers** are those who work fewer hours. Workers on part-time schedules for economic reasons (such as slack work, terminating or starting a job during the week, material shortages, or inability to find full-time work) are among those counted as being on full-time status, under the assumption that they would be working full time if conditions permitted. The survey classifies unemployed persons in full-time or part-time status by their reported preferences for full-time or part-time work.

Notes on the data

From time to time, and especially after a decennial census, adjustments are made in the Current Population Survey figures to correct for estimating errors during the preceding years. These adjustments affect the comparability of historical data presented in table 1. A description of these adjustments and their effect on the various data series appear in the Explanatory Notes of *Employment and Earnings*.

Data in tables 2–7 are seasonally adjusted, based on the seasonal experience through December 1979.

1. Employment status of the noninstitutional population, 16 years and over, selected years, 1950–79

[Numbers in thousands]

Year	Total noninstitutional population	Total labor force		Civilian labor force						Not in labor force

EMPLOYMENT, HOURS, AND EARNINGS DATA FROM ESTABLISHMENT SURVEYS

EMPLOYMENT, HOURS, AND EARNINGS DATA in this section are compiled from payroll records reported monthly on a voluntary basis to the Bureau of Labor Statistics and its cooperating State agencies by 166,000 establishments representing all industries except agriculture. In most industries, the sampling probabilities are based on the size of the establishment; most large establishments are therefore in the sample. (An establishment is not necessarily a firm; it may be a branch plant, for example, or warehouse.) Self-employed persons and others not on a regular civilian payroll are outside the scope of the survey because they are excluded from establishment records. This largely accounts for the difference in employment figures between the household and establishment surveys.

LABOR TURNOVER DATA in this section are compiled from personnel records reported monthly on a voluntary basis to the Bureau of Labor Statistics and its cooperating State agencies. A sample of 40,000 establishments represents all industries in the manufacturing and mining sectors of the economy.

Definitions

Employed persons are all persons who received pay (including holiday and sick pay) for any part of the payroll period including the 12th of the month. Persons holding more than one job (about 5 percent of all persons in the labor force) are counted in each establishment which reports them.

Production workers in manufacturing include blue-collar worker supervisors and all nonsupervisory workers closely associated with production operations. Those workers mentioned in tables 14–20 include production workers in manufacturing and mining; construction workers in construction; and nonsupervisory workers in transportation and public utilities, in wholesale and retail trade, in finance, insurance, and real estate, and in services industries. These groups account for about four-fifths of the total employment on private nonagricultural payrolls.

Earnings are the payments production or nonsupervisory workers receive during the survey period, including premium pay for overtime or late-shift work but excluding irregular bonuses and other special payments. **Real earnings** are earnings adjusted to eliminate the effects of price change. The **Hourly Earnings Index** is calculated from average hourly earnings data adjusted to exclude the effects of two types of changes that are unrelated to underlying wage-rate developments: fluctuations in overtime premiums in manufacturing (the only sector for which overtime data are available) and the effects of changes and seasonal factors in the proportion of workers in high-wage and low-wage industries. **Spendable earnings** are earnings from which estimated social security and Federal income taxes have been deducted. The Bureau of Labor Statistics computes spendable earnings from gross weekly earnings for only two illustrative cases: (1) a worker with no dependents and (2) a married worker with three dependents.

Hours represent the average weekly hours of production or nonsupervisory workers for which pay was received and are different from standard or scheduled hours. **Overtime hours** represent the portion of gross average weekly hours which were in excess of regular hours and for which overtime premiums were paid.

Labor turnover is the movement of all wage and salary workers from one employment status to another. **Accession rates** indicate the average number of persons added to a payroll in a given period per 100 employees; **separation rates** indicate the average number dropped from a payroll per 100 employees. Although month-to-month changes in employment can be calculated from the labor turnover data, the results are not comparable with employment data from the employment and payroll survey. The labor turnover survey measures changes during the calendar month while the employment and payroll survey measures changes from midmonth to midmonth.

Notes on the data

Establishment data collected by the Bureau of Labor Statistics are periodically adjusted to comprehensive counts of employment (called "benchmarks"). The latest complete adjustment was made with the release of June 1980 data, published in the August 1980 issue of the *Review*. Consequently, data published in the *Review* prior to that issue are not necessarily comparable to current data. Complete comparable historical unadjusted and seasonally adjusted data are published in a Supplement to Employment and Earnings (unadjusted data from April 1977 through March 1980 and seasonally adjusted data from January 1974 through March 1980) and in *Employment and Earnings, United States, 1909–78*, BLS Bulletin 1312–11 (for prior periods).

Data on recalls were shown for the first time in tables 12 and 13 in the January 1978 issue of the *Review*. For a detailed discussion of the recalls series, along with historical data, see "New Series on Recalls from the Labor Turnover Survey," *Employment and Earnings*, December 1977, pp. 10–19.

A comprehensive discussion of the differences between household and establishment data on employment appears in Gloria P. Green, "Comparing employment estimates from household and payroll surveys," *Monthly Labor Review*, December 1969, pp. 9–20. See also *BLS Handbook of Methods for Surveys and Studies*, Bulletin 1910 (Bureau of Labor Statistics, 1976).

The formulas used to construct the spendable average weekly earnings series reflect the latest provisions of the Federal income tax and social security tax laws. For the spendable average weekly earnings formulas for the years 1978–80, see *Employment and Earnings*, March 1980, pp. 10–11. Real earnings data are adjusted using the Consumer Price Index for Urban Wage Earners and Clerical Workers (CPI-W).

8. Employment by industry, 1950–79

[1] Not available.

NOTE: The earnings expressed in 1967 dollars have been adjusted for changes in price level as measured by the Bureau's Consumer Price Index for Urban Wage Earners and Clerical Workers. These series are described in "The Spendable Earnings Series: A Technical Note on its Calculation," **Employment and Earnings and Monthly Report on the Labor Force**, February 1969, pp. 6-13. See also "Spendable Earnings Formulas, 1978-80," **Employment and Earnings**, March 1980, pp. 10-11.

UNEMPLOYMENT INSURANCE DATA

UNEMPLOYMENT INSURANCE DATA are compiled monthly by the Employment and Training Administration of the U.S. Department of Labor from records of State and Federal unemployment insurance claims filed and benefits paid. Railroad unemployment insurance data are prepared by the U.S. Railroad Retirement Board.

Definitions

Data for **all programs** represent an unduplicated count of insured unemployment under State programs, Unemployment Compensation for Ex-Servicemen, and Unemployment Compensation for Federal Employees, and the Railroad Insurance Act.

Under both State and Federal unemployment insurance programs for civilian employees, insured workers must report the completion of at least 1 week of unemployment before they are defined as unemployed. Persons not covered by unemployment insurance (about one-third of the labor force) and those who have exhausted or not yet earned benefit rights are excluded from the scope of the survey. **Initial claims** are notices filed by persons in unemployment insurance programs to indicate they are out of work and wish to begin receiving compensation. A claimant who continued to be unemployed a full week is then counted in the insured unemployment figure. The **rate of insured unemployment** expresses the number of insured unemployed as a percent of the average insured employment in a 12-month period.

An **application** for benefits is filed by a railroad worker at the beginning of his first period of unemployment in a benefit year; no application is required for subsequent periods in the same year. **Number of payments** are payments made in 14-day registration periods. The **average amount of benefit payment** is an average for all compensable periods, not adjusted for recovery of overpayments or settlement of underpayments. However, **total benefits** paid have been adjusted.

21. Unemployment insurance and employment service operations

[All items except average benefits amounts are in thousands]

Item	1979								1980

[1] Initial claims and State insured unemployment include data under the program for Puerto Rican sugarcane workers.

[2] Includes interstate claims for the Virgin Islands. Excludes transition claims under State programs.

[3] Excludes data on claims and payments made jointly with other programs.

[4] Includes the Virgin Islands. Excludes data on claims and payments made jointly with State programs.

[5] Cumulative total for fiscal year (October 1 - September 30).

NOTE: Data for Puerto Rico included. Dashes indicate data not available.

PRICE DATA

PRICE DATA are gathered by the Bureau of Labor Statistics from retail and primary markets in the United States. Price indexes are given in relation to a base period (1967 = 100, unless otherwise noted).

Definitions

The **Consumer Price Index** is a monthly statistical measure of the average change in prices in a fixed market basket of goods and services. Effective with the January 1978 index, the Bureau of Labor Statistics began publishing CPI's for two groups of the population. One index, a new CPI for All Urban Consumers, covers 80 percent of the total noninstitutional population; and the other index, a revised CPI for Urban Wage Earners and Clerical Workers, covers about half the new index population. The All Urban Consumers index includes, in addition to wage earners and clerical workers, professional, managerial, and technical workers, the self-employed, short-term workers, the unemployed, retirees, and others not in the labor force.

The CPI is based on prices of food, clothing, shelter, fuel, drugs, transportation fares, doctor's and dentist's fees, and other goods and services that people buy for day-to-day living. The quantity and quality of these items is kept essentially unchanged between major revisions so that only price changes will be measured. Prices are collected from over 18,000 tenants, 24,000 retail establishments, and 18,000 housing units for property taxes in 85 urban areas across the country. All taxes directly associated with the purchase and use of items are included in the index. Because the CPI's are based on the expenditures of two population groups in 1972–73, they may not accurately reflect the experience of individual families and single persons with different buying habits.

Though the CPI is often called the "Cost-of-Living Index," it measures only price change, which is just one of several important factors affecting living costs. Area indexes do not measure differences in the level of prices among cities. They only measure the average change in prices for each area since the base period.

Producer Price Indexes measure average changes in prices received in primary markets of the United States by producers of commodities in all stages of processing. The sample used for calculating these indexes contains about 2,800 commodities and about 10,000 quotations per month selected to represent the movement of prices of all commodities produced in the manufacturing, agriculture, forestry, fishing, mining, gas and electricity, and public utilities sectors. The universe includes all commodities produced or imported for sale in commercial transactions in primary markets in the United States.

Producer Price Indexes can be organized by stage of processing or by commodity. The stage of processing structure organizes products by degree of fabrication (that is, finished goods, intermediate or semifinished goods, and crude materials). The commodity structure organizes products by similarity of end-use or material composition.

To the extent possible, prices used in calculating Producer Price Indexes apply to the first significant commercial transaction in the United States, from the production or central marketing point. Price data are generally collected monthly, primarily by mail questionnaire. Most prices are obtained directly from producing companies on a voluntary and confidential basis. Prices generally are reported for the Tuesday of the week containing the 13th day of the month.

In calculating Producer Price Indexes, price changes for the various commodities are averaged together with implicit quantity weights representing their importance in the total net selling value of all commodities as of 1972. The detailed data are aggregated to obtain indexes for stage of processing groupings, commodity groupings, durability of product groupings, and a number of special composite groupings.

Price indexes for the output of selected SIC industries measure average price changes in commodities produced by particular industries, as defined in the *Standard Industrial Classification Manual 1972* (Washington, U.S. Office of Management and Budget, 1972). These indexes are derived from several price series, combined to match the economic activity of the specified industry and weighted by the value of shipments in the industry. They use data from comprehensive industrial censuses conducted by the U.S. Bureau of the Census and the U.S. Department of Agriculture.

Notes on the data

Beginning with the May 1978 issue of the *Review*, regional CPI's cross classified by population size, were introduced. These indexes will enable users in local areas for which an index is not published to get a better approximation of the CPI for their area by using the appropriate population size class measure for their region. The cross-classified indexes will be published bimonthly. (See table 24.)

For further details about the new and the revised indexes and a comparison of various aspects of these indexes with the old unrevised CPI, see *Facts About the Revised Consumer Price Index*, a pamphlet in the Consumer Price Index Revision 1978 series. See also *The Consumer Price Index: Concepts and Content Over the Years*. Report 517, revised edition (Bureau of Labor Statistics, May 1978).

For interarea comparisons of living costs at three hypothetical standards of living, see the family budget data published in the *Handbook of Labor Statistics, 1977*, Bulletin 1966 (Bureau of Labor Statistics, 1977), tables 122–133. Additional data and analysis on price changes are provided in the *CPI Detailed Report* and *Producer Prices and Price Indexes*, both monthly publications of the Bureau.

As of January 1976, the Wholesale Price Index (as it was then called) incorporated a revised weighting structure reflecting 1972 values of shipments. From January 1967 through December 1975, 1963 values of shipments were used as weights.

For a discussion of the general method of computing consumer, producer, and industry price indexes, see *BLS Handbook of Methods for Surveys and Studies*, Bulletin 1910 (Bureau of Labor Statistics, 1976), chapters 13–15. See also John F. Early, "Improving the measurement of producer price change," *Monthly Labor Review*, April 1978, pp. 7–15. For industry prices, see also Bennett R. Moss, "Industry and Sector Price Indexes," *Monthly Labor Review*, August 1965, pp. 974–82.

---

[1] Data for February 1980 have been revised to reflect the availability of late reports and corrections by respondents. All data are subject to revision 4 months after original publication.

[2] Prices for natural gas are lagged 1 month.

[3] Includes only domestic production.

[4] Most prices for refined petroleum products are lagged 1 month.

[5] Some prices for industrial chemicals are lagged 1 month.

28. Producer Price Indexes, for special commodity groupings

[1967 = 100 unless otherwise specified]

Commodity grouping	Annual average 1978	1979							1980					
		June	July	Aug.	Sept.	Oct.	Nov.	Dec.	Jan.	Feb.[1]	Mar.	Apr.	May	June

PRODUCTIVITY DATA

PRODUCTIVITY DATA are compiled by the Bureau of Labor Statistics from establishment data and from estimates of compensation and output supplied by the U.S. Department of Commerce and the Federal Reserve Board.

Definitions

Output is the constant dollar gross domestic product produced in a given period. Indexes of **output per hour of labor input,** or labor productivity, measure the value of goods and services produced per hour of labor. **Compensation per hour** includes wages and salaries of employees plus employers' contributions for social insurance and private benefit plans. The data also include an estimate of wages, salaries, and supplementary payments for the self-employed, except for nonfinancial corporations, in which there are no self-employed. **Real compensation per hour** is compensation per hour adjusted by the Consumer Price Index for All Urban Consumers.

Unit labor cost measures the labor compensation cost required to produce one unit of output and is derived by dividing compensation by output. **Unit nonlabor payments** include profits, depreciation, interest, and indirect taxes per unit of output. They are computed by subtracting compensation of all persons from the current dollar gross domestic product and dividing by output. In these tables, **Unit nonlabor costs** contain all the components of unit nonlabor payments except unit profits. **Unit profits** include corporate profits and inventory valuation adjustments per unit of output.

The **implicit price deflator** is derived by dividing the current dollar estimate of gross product by the constant dollar estimate, making the deflator, in effect, a price index for gross product of the sector reported.

The use of the term "man-hours" to identify the labor component of productivity and costs, in tables 31 through 34, has been discontinued. **Hours of all persons** is now used to describe the labor input of payroll workers, self-employed persons, and unpaid family workers. **Output per all-employee hour** is now used to describe labor productivity in nonfinancial corporations where there are no self-employed.

Notes on the data

In the private business sector and the nonfarm business sector, the basis for the output measure employed in the computation of output per hour is Gross Domestic Product rather than Gross National Product. Computation of hours includes estimates of nonfarm and farm proprietor hours.

Output data are supplied by the Bureau of Economic Analysis, U.S. Department of Commerce, and the Federal Reserve Board. Quarterly manufacturing output indexes are adjusted by the Bureau of Labor Statistics to annual estimates of output (gross product originating) from the Bureau of Economic Analysis. Compensation and hours data are from the Bureau of Economic Analysis and the Bureau of Labor Statistics.

Beginning with the September 1976 issue of the *Review*, tables 31–34 were revised to reflect changeover to the new series—private business sector and nonfarm business sector—which differ from the previously published total private economy and nonfarm sector in that output imputed for owner-occupied dwellings and the household and institutions sectors, as well as the statistical discrepancy, are omitted. For a detailed explanation, see J. R. Norsworthy and L. J. Fulco, "New sector definitions for productivity series," *Monthly Labor Review*, October 1976, pages 40–42.

LABOR-MANAGEMENT DATA

MAJOR COLLECTIVE BARGAINING DATA are obtained from contracts on file at the Bureau of Labor Statistics, direct contact with the parties, and from secondary sources. Additional detail is published in *Current Wage Developments*, a monthly periodical of the Bureau. Data on work stoppages are based on confidential responses to questionnaires mailed by the Bureau of Labor Statistics to parties involved in work stoppages. Stoppages initially come to the attention of the Bureau from reports of Federal and State mediation agencies, newspapers, and union and industry publications.

Definitions

Data on wage changes apply to private nonfarm industry agreements covering 1,000 workers or more. Data on wage and benefit changes *combined* apply only to those agreements covering 5,000 workers or more. **First-year wage settlements** refer to pay changes going into effect within the first 12 months after the effective date of the agreement. **Changes over the life of the agreement** refer to total agreed upon settlements (exclusive of potential cost-of-living escalator adjustments) expressed at an average annual rate. **Wage-rate changes** are expressed as a percent of straight-time hourly earnings, while **wage and benefit changes** are expressed as a percent of total compensation.

Effective wage-rate adjustments going into effect in major bargaining units measure changes actually placed into effect during the reference period, whether the result of a newly negotiated increase, a deferred increase negotiated in an earlier year, or as a result of a cost-of-living escalator adjustment. Average adjustments are affected by workers receiving no adjustment, as well as by those receiving increases or decreases.

Work stoppages include all known strikes or lockouts involving six workers or more and lasting a full shift or longer. Data cover all workers idle one shift or more in establishments directly involved in a stoppage. They do not measure the indirect or secondary effect on other establishments whose employees are idle owing to material or service shortages.

35. Wage and benefit settlements in major collective bargaining units, 1975 to date

How to order BLS publications

PERIODICALS

Order from (and make checks payable to) Superintendent of Documents, Washington, D.C. 20402. For foreign subscriptions, add 25 percent.

Monthly Labor Review. The oldest and most authoritative government research journal in economics and the social sciences. Current statistics, analysis, developments in industrial relations, court decisions, book reviews. $18 a year, single copy, $2.50.

Employment and Earnings. A comprehensive monthly report on employment, hours, earnings, and labor turnover by industry, area, occupation, et cetera $22 a year, single copy $2.75.

Occupational Outlook Quarterly. A popular periodical designed to help high school students and guidance counselors assess career opportunities. $6 for four issues, single copy $1.75.

Current Wage Developments. A monthly report about collective bargaining settlements and unilateral management decisions about wages and benefits; statistical summaries. $12 a year, single copy $1.35.

Producer Prices and Price Indexes. A comprehensive monthly report on price movements of both farm and industrial commodities, by industry and stage of processing. $17 a year, single copy $2.25.

CPI Detailed Report. A monthly periodical featuring detailed data and charts on the Consumer Price Index. $15 a year, single copy $2.25.

PRESS RELEASES

The Bureau's statistical series are made available to news media through press releases issued in Washington. Many of the releases also are available to the public upon request. Write: Bureau of Labor Statistics, Washington, D.C. 20212.

Regional. Each of the Bureau's eight regional offices publishes reports and press releases dealing with regional data. Single copies available free from the issuing regional office.

BULLETINS AND HANDBOOKS

About 140 bulletins and handbooks published each year are for sale by regional offices of the Bureau of Labor Statistics (see inside front cover) and by the Superintendent of Documents. Washington, D.C. 20402. Make checks payable to the Superintendent of Documents. Among the bulletins and handbooks currently in print are these:

Occupational Outlook Handbook, 1978–79 Edition. Bulletin 1955. A useful resource supplying valuable assistance to all persons seeking satisfying and productive employment. $8, paperback; $11 hard cover.

BLS Handbook of Labor Statistics 1978. Bulletin 2000. A 604-page volume of historical data on the major BLS statistical series. $9.50.

Handbook of Methods. Bulletin 1910. Brief technical account of each major statistical program of the Bureau of Labor Statistics. $3.50.

BLS Measures of Compensation. Bulletin 1941. An introduction to the various measures of employee compensation; describes each series, the manner in which it is developed, its uses and limitations. $2.75.

Occupational Projections and Training Data. Bulletin 2020. Presents both general and detailed information on the relationship between occupational requirements and training needs. (Updates Bulletin 1918 published in 1976.) $3.25.

Technological Change and its Labor Impact in Five Energy Industries. Bulletin 2005. A 64-page study appraising major technological change and discussing the impact of these changes on productivity and occupations over the next 5 to 10 years. $2.40.

BLS Publications, 1972–77. Bulletin 1990. A numerical listing and subject index of bulletins and reports issued by the Bureau from 1972 through 1977, supplementing Bulletin 1749, covering 1886–1971. $1.80.

International Comparisons of Unemployment. Bulletin 1979. Brings together all of the Bureau's work on international unemployment comparisons. Describes the methods of adjusting foreign unemployment rates in 8 countries to U.S. concepts. $3.50.

Productivity Indexes for Selected Industries, 1979 Edition. Bulletin 2054. A 190-page report of indexes of output, employment, and employee hours in selected industries from 1954 to 1978. This edition contains measures for three industries previously not covered, as well as components of previously published measures in 10 industries. $5.50.

Profiles of Occupational Pay: A Chartbook. Bulletin 2037. A graphic illustration of some of the factors that affect workers' earnings. This three-part presentation looks at wage variations among and within occupations and portrays characteristics of high- and low-paying urban areas and manufacturing industries. $3.50.

REPORTS AND PAMPHLETS

Single copies available free from the BLS regional offices or from the Bureau of Labor Statistics, U.S. Department of Labor, Washington, D.C. 20212.

How the Government Measures Unemployment. Report 505. A concise report providing a background for appraising developments in the area of unemployment.

Directory of BLS Studies in Industrial Relations 1960–78. Report 550. A listing of studies prepared by the Division of Industrial Relations as part of the Bureau's regular program of data collection and analysis in the field of industrial relations.

☆ U.S. GOVERNMENT PRINTING OFFICE: 1980 O— 311-406/43

Characteristics of Major Collective Bargaining Agreements

For the labor relations practitioner and student—

A handy statistical reference on 1520 of the largest collective bargaining agreements in the United States.

More than 80 tables and 7 charts and graphs dealing with agreement characteristics:

- Union security, management rights, and related provisions
- Wages and wage-related clauses
- Hours, overtime, and premium pay
- Paid and unpaid leave
- Seniority and seniority-related provisions
- Job security arrangements
- Dispute settlement procedures

All data are derived from a broad review of agreements currently on file with the Bureau of Labor Statistics covering at least 1,000 workers and in effect on January 1, 1978, or later.

Bulletin 2065 reports the results of negotiations involving some of the largest companies and unions in the United States.

Labor Month In Review

STATE AND LOCAL PAY. The Bureau of Labor Statistics issued the first of a new series of releases on wages and benefits of State and local government employees in collective bargaining units of 5,000 workers or more. About one-fourth of all workers covered by collective bargaining agreements in State and local government were in such units in 1979. The release includes data on both first-year changes and annual rates of change over the life of multiyear settlements negotiated in 1979.

Wages and benefits. First-year wage and benefit adjustments averaged 7 percent under 1979 settlements covering 5,000 or more State and local government workers. Major settlements in the private economy brought wage and benefit changes of 9 percent in 1979, but were not entirely comparable because they included pensions and other benefits not subject to collective bargaining in the public sector.

Contracts which offered the prospect of additional adjustments under automatic cost-of-living escalator (COLA) clauses provided smaller (6.5 percent) first-year settlements than contracts without such clauses (7.2 percent). First-year changes were slightly higher (7.0 percent) for State government workers than for workers in local government (6.8 percent).

Over the life of multiyear contracts, wage and benefit adjustments averaged 6.3 percent a year for both State and local government workers. Contracts with COLA clauses provided wage and benefit changes of 5.1 percent, while those without such clauses averaged 7.0 percent.

Wages only. Data on wage settlements alone show average first-year changes of 6.8 percent for workers in large State and local government units, with local government workers holding a slight edge (7.0 percent) over State government employees (6.7 percent). Similarly, over the life of multiyear contracts, local government workers won slightly higher settlements (6.5 percent) than State government employees (6.2 percent).

Groups covered. Agreements reached in 1979 affected 568,000 workers in 45 State and local government bargaining units of 5,000 or more employees. Teacher units accounted for about 25 percent of the workers covered, with general government or administrative units accounting for another 20 percent. The rest were in clerical, blue-collar, health, and other units.

About 48 percent were in the Northeast region, 22 percent in the North Central States, 21 percent in the West, and 9 percent in the South.

Two-year agreements covered about 43 percent of the workers under the 1979 agreements. About 23 percent were under 1-year pacts and 34 percent under 3-year agreements.

Escalator provisions. Nine of the 1979 settlements included COLA provisions. Eight other COLA clauses were in effect from bargaining in prior years. A total of 309,000 workers were covered by escalator provisions in 1979. Mainly because 1979 agreements deferred escalator reviews until 1980 or later, cost-of-living clauses triggered permanent wage-rate adjustments in only seven agreements, covering 76,000 workers. Of these, 71,000 were employed by local governments, largely as transit workers(43,000).

Effective changes. In addition to reporting on 1979 settlements, the new BLS release also reports on the wage increases actually paid during the year to State and local government workers in units of 5,000 or more. A total of 884,000 workers in 69 public sector collective bargaining units collected increases averaging 6.2 percent. About 73,000 workers in 10 bargaining units received no increases. When prorated over all 957,000 workers in major bargaining units, the effective wage adjustment averaged 5.8 percent in 1979, with 4.0 percent coming from new settlements, 1.2 percent from deferred increases paid under agreements negotiated in prior years, and 0.5 percent from COLA clauses.

More complete data. Information in the new BLS release is based on preliminary data. A revised report, based on more complete data, will appear in a forthcoming issue of *Current Wage Developments,* a monthly periodical published by BLS.

Meanwhile, single copies of the release, USDL: 80-501, are available from the Inquiries and Correspondence Section, BLS, Washington, D.C. 20212. □

Are women safer workers? a new look at the data

The overall better record of women may reflect the fact that relatively few are in hazardous jobs; data from 26 States suggest that men and women doing the same kind of work incur similar injuries with about the same frequency

NORMAN ROOT AND JUDY R. DALEY

Women have a relatively better work injury record than do men, much of which may be attributed to the kinds of work in which women are engaged. They are underrepresented in the crafts and kindred occupations, in which very large numbers of injuries occur. A large proportion of on-the-job injuries among women occurs in traditionally female-dominated occupations—teaching, nursing, clerical jobs, assembling, and retail sales, for example.

The characteristics of occupational injuries and illnesses are similar for women and men. There are a few noteworthy exceptions: women suffer relatively more "falls on the same level" than do men, which may be the result of wearing shoes with higher heels; women also appear to experience relatively more illnesses related to occupations, particularly inflammation of joints, tendons, and muscles.

This article provides the first comprehensive look at female work-related injuries and illnesses by occupation, industry, and by specific characteristic of the injury (for example, nature of the injury or illness, part of body affected, source of the injury, and type of accident or exposure causing the injury). In this analysis, the term "injury" includes both injuries and illnesses.

The data are from reports made to State workers compensation agencies. The Bureau of Labor Statistics developed the Supplementary Data System to assist States in uniformly classifying and coding data obtained in connection with administration of State workers' compensation laws. The State agencies, in turn, provide the Bureau with information about the industrial classification of the establishment in which the injured was employed, occupation, age, and sex of the injured employee, nature of injury, part of body affected, source of the injury, and type of accident or exposure which produced the injury.[1] Although classification and processing are uniform, the injury data are subject to a number of limitations because reporting and coverage requirements for workers' compensation differ among States.[2]

This report compares the proportionate values of injuries and employment within a given universe (for example, female workers, manufacturing). Employment

---

Norman Root is a division chief and Judy R. Daley a research analyst in the Office of Occupational Safety and Health Statistics, Bureau of Labor Statistics.

data for industry and occupation are from *Employment and Earnings*, a monthly publication of the Bureau of Labor Statistics.[3] Data limitations do not permit computation of rates. The 26 States, whose data are used in this analysis, accounted for about 40 percent of wage and salary employment and are considered representative of the industrial activity in the Nation. These States provided information on cases that either occurred or were reported to workers' compensation agencies in 1977.

Young workers susceptible

About 1.5 million injuries,[4] or 21 percent of all occupational injuries, occur to women. The proportion of work-related injuries ranged from 10 percent of all such injuries in Wyoming to 25 percent in Minnesota. Employment of women in these States ranged from 37 percent to 45 percent of all employed workers.[5] (See table 1.) Wyoming, Alaska, New Mexico, and Utah had noticeably low percentages of injuries, probably because of the industrial mix of jobs in these States. They have large numbers of traditionally male-dominated hazardous jobs, such as mining, ranching, construction, and oil-well drilling.

The largest percentage of female injury cases was accounted for by younger workers. The injury-to-employment ratio for women was relatively consistent for all age groups. However, compared with men, younger women (16 to 34 years) had lower injury-to-employment ratios and older women (35 to 64 years), higher ratios. For men, the injury-to-employment ratio was higher for those age 16–34 and lower for the succeeding age groups.

Table 1. Employment and work-related injuries and illnesses among women, selected States, 1977

State	Female employment as percent of total employment[1]	Injuries and illnesses	
		Total cases	Percent incurred by women
Total	40.6	1,250,284	21.1
Alaska	41.8	8,841	14.9
California	41.1	327,868	22.5
Colorado	40.4	33,054	19.9
Connecticut	42.2	[2]11,441	17.4
Hawaii	44.5	36,603	22.5
Idaho	39.0	38,290	17.9
Indiana	40.2	38,398	21.8
Iowa	40.0	18,510	19.8
Kentucky	39.8	51,015	18.9
Maine	40.5	43,828	21.0
Maryland	40.8	30,551	20.7
Michigan	38.6	70,537	23.0
Minnesota	39.9	50,802	25.0
Missouri	42.4	128,590	20.4
Montana	38.8	32,281	18.0
Nebraska	41.4	35,249	20.6
New Jersey	40.7	84,753	21.8
New Mexico	40.9	4,046	15.4
Oregon	39.9	43,777	21.0
South Dakota	39.4	17,397	21.4
Tennessee	41.6	25,649	19.9
Utah	38.6	20,491	16.6
Vermont	40.3	17,952	21.8
Virgin Islands	([3])	1,531	18.0
Wisconsin	40.5	60,626	21.5
Wyoming	37.6	17,204	10.3

[1] *State Profile of Employment and Unemployment, 1977*, Report 539 (Bureau of Labor Statistics, October 1978). The total is for the 25 States for which data were available.

[2] In 1977, Connecticut provided injury and illness information only for manufacturing industries, excluding boat building and repair.

[3] Not available.

Because a high proportion (about 40 percent) of all occupational injuries are sustained during a worker's first year on the job, the relatively high injury-to-employment ratio experienced by younger men can be expected.[6] The consistent injury to employment ratio of women, therefore, could indicate that they, perhaps, are "safer" workers in the sense that their injury experience remains proportionate to their exposure; that, perhaps, women are experiencing more turnover in employment, (that is, continue to enter and leave the work force throughout their working years); or that the low level of upward mobility in the "female jobs" (such as charwomen, nursing aides, and assemblers) keeps women exposed to the same hazards of the work environment throughout their working years.

Injuries more frequent in manufacturing

Despite some changes in their employment patterns, women remain concentrated in the same industry groups as in previous years.[7] And, significant numbers of injuries continued to occur in those industries. Manufacturing industries accounted for 30 percent of all injuries to female workers, followed by 24 percent in services, 19 percent in retail trade, and 17 percent in the public sector. The following tabulation shows the distribution of female work injuries by industry, 1977:

	Percent
Private sector	82.9
Agriculture, forestry, and fishing	1.3
Mining	.2
Construction	.6
Manufacturing	30.0
Transportation and public utilities	2.5
Wholesale trade	2.9
Retail trade	19.4
Finance, insurance and real estate	2.3
Services	23.7
Public sector	17.1
State government	5.5
Local government	11.6

Among manufacturing industries with significant numbers of female work-related injuries, food and kindred products accounted for the most, followed by electric and electronic equipment, fabricated metals products, transportation equipment, apparel and other textile products, rubber and miscellaneous plastics products, and machinery (except electrical) products. About two-thirds of the female work-related injuries in the private sector of the services industry occurred in hospitals and health care facilities. In retail trade, the largest components of female work-related injuries occurred in eating

Table 2. Employment and work-related injuries and illnesses among women in selected industries, 1977

Industry	Female employment as percent of total employment	Injuries and illnesses	
		Total cases	Percent incurred by women
Total	40	1,250,284	21.1
Private sector—all industries	39	1,085,223	20.2
Agriculture, forestry, and fishing	(1)	29,403	11.5
Mining	8	27,266	1.6
Construction	7	117,474	1.3

[1] Data are not available.

and drinking places, general merchandise stores, and food stores. In the public sector, local government accounted for two-thirds of the work-related injuries sustained by women, many of whom were in education.

Relative to their employment, work-related injuries among women varied widely by industries. (See table 2.) In manufacturing industries, their relative injury experience was greater than or close to their relative employment in these industries: lumber and wood products, primary metals, metal forgings and stampings, electric and electronic equipment, transportation equipment, instruments and related products, miscellaneous foods and kindred products, and tobacco manufacturing. In air transportation, banking, and health services, similar relative positions occurred. The work-related injury rates for women in these industries would be at least comparable to those of men.

In contrast, the following industries with a significantly large number of cases show a much higher proportion of employment than of injuries incurred by women: miscellaneous manufacturing, food and kindred products, textile mill products, apparel and other textile products, printing and publishing, leather and leather products, transportation and public utilities generally, wholesale and retail trade generally, real estate, services generally and local government.

Service workers—most cases

Two occupational groups—service workers and operatives, except transport—accounted for slightly more than 50 percent of total injuries to women. Clerical occupations made up 12 percent of the cases, followed by laborers (except farm) and professional, technical and kindred workers with 9 and 8 percent. Following are

Table 3. Employment and work-related injuries and illnesses among women in selected occupations, 1977

Occupation	Female employment as percent of total employment	Injuries and illnesses	
		Total cases	Percent incurred by women
Total	40.5	1,250,284	21.1
Professional, technical and kindred workers	42.6	43,738	49.3

the occupational distribution of female work-related injuries, 1977:

	Percent
Professional, technical and kindred workers	8.2
Managers and administrators, except farm	2.9
Salesworkers	3.6
Clerical and kindred workers	11.8
Crafts and kindred workers	2.6
Operatives, except transport	21.8
Transport equipment operatives	1.6
Laborers except farm	8.6
Farm laborers and foremen	.9
Service workers, except private household	30.6
Private household workers	.2

The occupational distribution of work-related injuries indicates one reason for the relatively low numbers of injuries to women. Men accounted for 95 percent of employment and experienced 97 percent of the work injuries in the crafts and kindred workers group. The injuries in this occupational group accounted for 22 percent of all work injuries to men. For women, on-the-job injuries in this occupational group made up only 3 percent of all work injuries. (See table 3.) Thus, women had very little exposure to one of the most hazardous occupations.

Work-related injuries among women generally reflected their concentrations of employment. In the following occupations, women made up 60 percent or more of employment and injuries: nursing and other health related occupations, teaching, retail sales, bookkeeping, clerical jobs, sewing and stitching, and several food-related occupations. Women employed as managers and administrators, sales workers, operatives (such as assemblers, and packers and wrappers), and laborers experienced significant percentages of injuries relative to their employment.

Profile of occupational injuries

The characteristics of the work-related injuries that occurred to women were generally similar to those affecting men. For example, sprains and strains were the most frequently occurring injuries for both groups; the back and fingers were the body parts affected more than one-third of the time; and overexertion resulted in about 1 of 5 injuries. However, the sources of the injuries varied markedly for the two groups, reflecting the different work environments and, therefore, different potentials for producing injuries. Working surfaces caused 19 percent of all female work-related injuries, but only 12 percent of the male injuries. Conversely, metal items were responsible for 15 percent of male injuries, but only 5 percent of injuries to women. A person as a source of injury (primarily the lifting and handling of them) was responsible for 9 percent of the female injuries, but for only 2 percent of the men's.

As noted, sprains and strains accounted for more than one-third of the injuries occurring to women, followed by contusions and bruises, cuts, lacerations, and punctures, fractures, and burns. Other frequent injuries included scratches and abrasions and inflammation of joints, tendons, and muscles. (See table 4.)

About 30 percent of the injuries involved the upper extremities and about half of the time included the fingers. An additional 30 percent of injuries involved the trunk, largely the back. (See table 5.) The lower extremities frequently involving the toes, accounted for 19 percent of the injuries; the head and multiple body parts each accounted for about 8 percent; and injuries to the eyes accounted for 3 percent.

Data on the sources of work injuries generally reflect the work environment more closely than any other classification because many of the individual categories are peculiar to specific industries, each with special machines, equipment, or exposures. Thus, the source classification has many more categories than other classifications. (See table 6.) Two categories—working surfaces and boxes, barrels and containers—common to all industries, accounted for nearly one-third of all the injuries occurring to women, and for 22 percent of injuries occurring to men. Three other categories combined made up nearly 1 of 4 female work-related injuries—person, bodily motion, and machines. Again, these sources reflect the fact that women are heavily employed as nurses, teachers, wrappers and packers, assemblers, and health and food service workers.

A look at accidents which cause injuries on the job can provide clues for targeting safety programs.[8] Among women, the most frequent accidents were struck against or struck by, overexertion, and fall on the same level. (See table 7.) Nearly 1 of 5 injuries were caused by the combined accidents, bodily reaction, caught in-under-between, and fall from elevation. Similar types of accidents caused injuries to women and men. The only significant differences were for fall from the same level, which accounted for 1 of 6 injuries to female workers, compared with 1 of 13 for men, and for struck against or struck by which accounted for one-fourth of the injuries incurred by women and one-third of those incurred by men.

Table 4. Nature of work-related injury

Nature	Women		Men

Motor vehicle accidents	3,478	1.3	21,925	2.2

Illness a greater problem. Illnesses peculiar to one's occupation were a relatively greater problem for women than men. Occupational illnesses accounted for nearly 7 percent of all injuries and illnesses of women, but less than 5 percent of the men's.[9]

Three categories made up two-thirds of the occupational illnesses of women—inflammation or irritation of joints, tendons, and muscles, dermatitis, and systemic poisoning. (See table 8.) These accounted for 59 percent of the illnesses occurring to men. Other significant categories of female occupational illnesses were infective or parasitic diseases, mental disorders, and effects of changes in atmospheric pressure (limited almost exclusively to stewardesses in the air transportation industry).

The frequency and types of illnesses reflect employment and exposures (as indicated, for example, by the experience of airline stewardesses). Nearly a third of all female work-related illnesses occurred in manufacturing industries; 62 percent of the illnesses involved inflammation of joints, tendons, and muscles; 53 percent, dermatitis, and 39 percent, systemic poisoning. Five industries combined—food, fabricated metals, machinery (electric and nonelectric) and transportation equipment—had more than 50 percent of each of these illnesses. Inflammation of joints, tendons and muscles were particularly associated with the repetitive movements of assembly-type activities, and women appeared to be more prone to this illness than men. Services accounted for 24 percent of all female occupational illnesses, with a large concentration in health services, reflecting among other things, exposures to infective and parasitic diseases. Retail trade, especially eating and drinking places, accounted for 19 percent of female occupational diseases. The public sector accounted for 17 percent of female occupational illnesses and included high proportions of infective and parasitic diseases, mental disorders, and circulatory conditions. Many of these conditions are associated with occupations in health, education, and social services provided by State and local governments.

Are women safer workers than men?

Given the same job will women suffer the same injuries as do men? Comparisons of the relative frequency and kinds of injuries occurring to both women and men in the same occupations and industries indicate that work activity, not the worker, is a more important determinant of injuries. The data show that women in traditionally male-dominated jobs will suffer the same kinds of injuries and generally with the same relative frequency as their male counterparts. Also men in traditionally female-dominated occupations will suffer injuries common to their female counterparts and with the same frequency.

Table 9 presents some injuries and illnesses frequently occurring in selected occupations. The similarities of characteristic clusters which reflect exposures to the work environment are the main features of the data. For example, if the category "strains and sprains" among female nursing aides is larger than the national average for women, it is also larger than the average for men; or if a "person" as a source of injury among female laborers is smaller than the national average for women, it is also markedly smaller for men. Other significant clusters which reflect the exposures of the working environment include: dermatitis and inflammation of joints, tendons, and muscles among assemblers; bodily

[2] See Norman Root and David McCaffrey, "Providing more information on work injury and illness," *Monthly Labor Review*, April 1978, pp. 16-21.

[3] The industry and occupational employment series are not comparable but are the most reliable data available on national employment by sex. The occupational employment series also contains significant numbers of workers not covered by State workers' compensation (for example, self-employed and unpaid family workers) and to this extent, relative employment ratios are overstated. The major factors which have a differential effect on the two series are detailed in *Employment and Earnings*, March 1978, pp. 139-59.

[4] The estimate was derived by applying the percentage of female work injuries in the Supplementary Data System data base to the 1977 national total of injuries and illnesses—approximately 5.5 million—obtained through the Bureau's annual survey of occupational injuries and illnesses. Because the annual survey does not include public sector employment injuries, the estimate includes an upward adjustment to account for such injuries. Public sector injuries accounted for 17 percent of all injuries in the Supplementary Data System; of these, women accounted for 27 percent.

[9] It should be noted that occupational illnesses among all workers are reputed to be understated because of difficulties in diagnosis and in associating an illness with the workplace. To this extent, occupational illnesses as a proportion of all injury and illness cases may be larger than that identified.

Occupational disease—difficult diagnosis

The primary difficulty in identifying diseases as occupational in origin occurs when the cause of disease is not known, as in mental illness. In 1970 over 800,000 persons had their activities limited to some degree due to mental and nervous conditions. Even though psychological, chemical, physical injuries, heredity, or other causes of some mental disorders may be identified, we have no idea how the bulk of such illnesses originate. Because the cause of many such disturbances is not known, the contributing role of the workplace cannot readily be evaluated. Due to the large number of potential cases involved, however, the handling of such conditions would substantially affect the number of occupational disease cases estimated. The problem involves more than simply the absence of medical certainty about cause. Even if it were known that the stresses of life can cause such illnesses, what contributive role do job-related pressures play in the development of the disorder? If job loss began the process that led to an emotional disturbance, could this be termed an occupational disease? If so, one probably should also consider as an occupational disease an illness resulting from the frustration of an unsuccessful job search even if the individual in question had never previously been employed.

If stress-induced emotional disabilities can be considered occupational diseases, so can similarly caused cardiovascular illnesses and alcoholism. Workers' compensation practitioners are aware that some heart disease cases are currently being compensated as job related, but few if any cases of alcoholism are being seen by the system.

Occupational safety and health: a report on worker perceptions

Hazardous working conditions erode job satisfaction, say increasing numbers of workers; especially threatened is the inexperienced employee, who is the most likely to be injured on the job but least willing to bring potential dangers to the attention of management

RICHARD L. FRENKEL, W. CURTISS PRIEST,
AND NICHOLAS A. ASHFORD

In 1969, 1972, and most recently in 1977, the Institute for Social Research at the University of Michigan conducted opinion surveys of production workers, under U.S. Department of Labor sponsorship. These studies, known as the "Quality of Employment Surveys," gather data on numerous characteristics of the worker and his job, and perhaps most importantly, on the worker's subjective assessment of his worklife.[1] For the analyst, the surveys provide information about worker opinions and job satisfaction not readily available elsewhere. And, because many of the questions asked remain essentially unchanged from one survey to the next, the data may be used to chart major changes in attitudes toward various aspects of work over time.

Certain questions relate to job safety and health, or to workers' evaluation of safety as a job attribute. Under contract to the Department of Labor, the Center for Policy Alternatives at the Massachusetts Institute of Technology has examined data pertaining to a number of these safety- and health-related questions.[2] This article summarizes some salient results of that study.

Time trends in injury rates

Over the 8 years spanned by the Quality of Employment Surveys, work-injury rates reported by the Bureau of Labor Statistics have fallen.[3] Similarly, results from the Quality of Employment Surveys also indicate that the number of injuries clearly related to job activities, such as fractures and cuts, has declined. It is surprising then, that when asked generally about "work-related" injuries, survey respondents note a slight increase between 1969 and 1977.[4] A detailed breakdown of the types of injuries reported by the workers suggests the cause of this apparent paradox: health problems of various kinds are increasingly perceived as due to workplace exposures. Because of the difficulty in proving the work-relatedness of many of these health problems, such "injuries" are not reflected in government statistics.

It is likely that the increase in perceived injuries results from greater worker sensitivity to a variety of occupational hazards. In 1977, 78 percent of those surveyed noted one or more safety and health hazards in the workplace, compared with only 38 percent in 1969. Respondents in the most recent study were asked to be more specific about the types of dangers they encountered on the job. Seventy-two percent of the men reported exposure to "fumes, dust, or other air pollution," as did 52 percent of the women. Similarly, 45 percent of the men and 21 percent of the women felt themselves exposed to "dangerous chemicals." Other significant workplace hazards, and the percentage of workers reporting each are shown below:

Richard L. Frenkel is a research specialist, W. Curtiss Priest, the project director, and Nicholas A. Ashford, a principal investigator at the Center for Policy Alternatives, Massachusetts Institute of Technology.

Hazard	*Men*	*Women*
Exposure to dangerous chemicals	45	21
Fire or electric shock	52	30
Fumes, dust or air pollution	72	52
Weather (outdoor)	52	10
Extremes of indoor temperature or humidity	35	47
Badly maintained or dirty workplace	37	26
Dangerously stored or misplaced items	24	13
Noise	45	54
Dangerous tools or equipment	55	37
Disease (contagious)	19	15
Traffic	38	13
Personal violence	21	11
Dangerous work methods	30	19
Other hazards	3	2

Another trend evident in the data is the increase in work-related injuries reported by women. Female production workers averaged over twice as many injuries in 1977 as in either 1972 or 1969, perhaps because by making inroads into traditionally male occupations, women are sharing the greater risks of these jobs as well.[5]

Job satisfaction and risk

In the 1977 Quality of Employment Survey, workers were also asked questions about their level of job satisfaction. Workers who reported exposure to a greater number of hazards, or who felt these hazards were more severe than average, were significantly less satisfied with their jobs.[6] However, while it is tempting to infer that hazard exposure leads to lower job satisfaction, it is also possible that workers who were generally dissatisfied with their jobs for other reasons noted a greater number of hazards.[7]

Worker preference for safety and health

In 1977, respondents were asked to decide whether they would prefer a 10-percent pay raise or various other job improvements. Among these other improvements was "a little safer or healthier working conditions." By this "revealed preference" method, it was determined that nearly a third of all production workers would be willing to trade the pay increase for more safety and health at work. Other compensating benefits, and the fraction of production workers willing to trade a pay raise for each one:

Benefit	*Percent of workers*
Increased retirement benefits	65.9
More medical insurance	58.1
More paid vacation	57.5
Shorter workweek	42.4
Greater chance for promotion	40.6
Greater job security	33.7
A little more safety and health	33.1
Greater comfort at work	28.7
More interesting work	27.5
Greater freedom to decide work	18.2

While retirement benefits and medical insurance are universal concerns, occupational safety and health is likely to be important chiefly to those significantly at risk. Consequently, the figures above may underrepresent the willingness of hazard-exposed workers to forgo pay increases for safety improvements. For example, the 1977 data show that previously injured workers are more concerned about safety and health improvements than other groups. The same is true of union members, perhaps reflecting the greater unionization of risky jobs. And, workers who note workplace hazards, or who have specific health symptoms, are also generally more willing to sacrifice increased pay for a little more safety and health.

Working conditions and injury rates

A number of possible working conditions were introduced in the 1977 Quality of Employment Survey questionnaire. Workers were asked to decide which of these conditions were characteristic of their jobs. Thus, a worker could describe his job as being repetitious or interesting, or as requiring a high level of skill, or much physical effort.

Workers who noted "negative" working conditions also reported, on average, a greater number of job-related injuries. In particular, "fast" or "hard" work, and work requiring "considerable physical effort," were frequently associated with injuries. Workers who felt that they did not have enough authority, information, or assistance to do their jobs properly also had higher injury rates than other workers.

Many of these job characteristics were likewise related to the number of health symptoms reported by workers. These symptoms include such problems as "trouble breathing" or "back pains," and do not have to be work related. A larger number of symptoms seems to be associated with generally "negative" job qualities, while fewer symptoms are associated with "positive" job qualities:

"Negative" job qualities	*"Positive" job qualities*
Fast work pace	Need to learn new things fast
Work hard	Job allows freedom
Repetitious work	Job requires high skill level
Not enough help	Job has variety of work
Not enough authority	
Not enough facts and information	
Not enough tools and equipment	
Not enough time to do the job right	

These results suggest a causal relationship between work characteristics and health problems. Again, however, subjective bias may influence the results, as workers who are "generally dissatisfied" may tend to report both more negative job characteristics and a greater number of health problems.

Tenure and perceived hazards

Other studies have found a significant relationship between a worker's tenure and the probability that he will have an accident.[8] The survey data illustrate this relationship dramatically: workers employed between 1 and 3 months report 3 times as many injuries as workers with from 1 to 3 years on the job, and 8 times as many as those employed for more than 20 years.[9]

Perceived hazard exposure is also related to tenure. Workers who note badly maintained or dirty workplaces, or dangerously stored items, stay significantly shorter periods than other workers. Only perceived noise exposure does not seem to bear much relationship to tenure; workers who report exposure to noise do not have shorter average tenures than others.[10]

While workers who have been on the job for a relatively short time often note exposure to a greater number of hazards than other workers, they do not generally feel endangered. On the other hand, workers with longer tenures cite fewer hazards, but are more apt to judge them as "severe." It would seem from these results, and the data on injuries, that workers relatively new to the job may in fact be exposed to a greater number of hazards, but that they may underestimate the danger from these hazards.

Reporting of hazards by workers

When workers noted a hazard they felt to be "great" or "sizable," they were asked if they had "reported" it to anyone. The rate at which workers reported such dangers is influenced by a number of factors, the most important of which is tenure: fewer than 30 percent of employees with less than 3 months' tenure reported a severe hazard, compared with nearly 70 percent of those with between 5 and 10 years on the job. Union membership, age, and education were not significantly related to the hazard report rate. However, women, and employees who felt that their employers would not keep them fully informed about potential dangers were more likely than others to report a severe hazard.

When workers did report a hazardous condition to someone, 8 out of 10 did so to an immediate supervisor or other management personnel. Reports to a Government agency at any level constituted about 7 percent of all complaints, and reports to union representatives, less than 6 percent.[11]

Priorities of union members

The 1977 Quality of Employment Survey provides considerable information about worker-perceived union performance in various areas of concern, including job safety and health. The following tabulation lists a number of possible areas of union activity, in the order in which workers feel effort should be expended. Thus, "handling grievances" is the area in which union workers want their unions to expend most effort, while "increasing worker input in business decisions" is the area in which they feel the least effort is needed:

Area of union concern	*Effort ranking*
Handling grievances	1
Keeping membership informed of union action	2
Improving fringe benefits	3
Increasing membership input in union direction	4
Increasing job security	5
Increasing wages	6
Increasing occupational safety and health	7
Increasing worker "say" in how the job is performed	8
Increasing job interest	9
Increasing worker input in business decisions	10

By and large, workers feel that their unions do pursue these goals in the correct order.[12] The greatest shortfalls between "desired effort" and "perceived performance" are in the areas of increasing membership input in union direction and handling of grievances. Monitoring of health and safety ranks seventh in shortfall of perceived union effort. However, it is noteworthy that union workers want almost as much effort spent on improving safety and health conditions as on increasing wages.

OSHA fines and survey data compared

The Occupational Safety and Health Administration (OSHA) collects data on inspection activity and fines as part of the Management Information System.[13] By combining these data with those from the Quality of Employment Survey, it was possible to explore the relationship of worker-perceived hazards to the level of OSHA fines in any industry. Dollars of proposed penalty per hour of inspection time was chosen as a measure of the severity of safety violations noted by OSHA inspectors. This measure was assumed to be fairly independent of total industry employment.

OSHA's proposed penalty per hour of inspection time was higher in industries in which workers themselves noted the hazards of "noise," "dangerous work methods," "fire or shock," or "dangerous equipment." Worker perception of these dangers would thus seem to agree with the findings of OSHA inspectors.

OSHA fines did not vary significantly with the mean age of surveyed workers in an industry, or with their sex, race, income, or willingness to pay for health and safety. On the other hand, proposed penalties were highest for industries represented predominantly by very small firms (those with under 10 employees) or very large firms (those with over 2,000 employees) on the Quality of Employment Surveys. While these differences are not large, they are unexpected, because medium-size firms have the highest reported injury rates.[14]

Conclusions

Information gathered in the Quality of Employment Surveys permits investigation of the relationship between various aspects of work, and worker satisfaction. The results of this study reveal that job safety and health are important concerns for most workers, and that such concerns are on the increase. While this conclusion should be encouraging to policymakers, certain problem areas in safety and health regulation were also identified.

The first of these involves the long recognized relationship between job tenure and injury probability. Stated simply, workers who are new on their jobs have several times the probability of injury of more experienced workers. At the same time, they are the least willing to report even severe perceived hazards to anyone, probably because hazard reports must usually be directed to management. Finally, union handling of safety-related grievances is often felt to be inadequate by union members, and, consequently, few reports of dangerous conditions are directed through union channels. Mechanisms are needed to encourage new workers to report what they feel are severe hazards, and to provide all workers with alternatives when appeals to management fail.

The results of this study have implications for employers as well. Unpleasant working conditions generally, and injury-causing hazards in particular seem to go hand in hand. It is likely that a concerned management acts to alleviate unpleasant working conditions, including hazards. On the other hand, it is possible that workers who report hazards tend to note unpleasant work conditions because of their general job dissatisfaction. Further investigations are needed to help pinpoint the relationship between inadequate job safety and health and individual firm management styles. Such studies could also clarify the role of hazard abatement in improving employee morale. □

FOOTNOTES

Data are based on personal interviews with members of a national household probability sample of employed persons 16 years or older who worked for pay 20 hours a week or more. Thus, the term "workers" is defined to include adults substantially engaged in remunerative employment.

The 1969 survey included all eligible respondents in each of the sample households. During the 1973 and 1977 surveys, only one worker per household was interviewed, but responses were appropriately weighted to compensate for the underrepresentation of workers in multiple-worker families.

[2] U.S. Department of Labor, Contract J-9-F-8-0131, funded by the Office of the Assistant Secretary for Policy, Evaluation and Research. See Richard L. Frenkel and W. Curtiss Priest, *Health, Safety, and the Worker: An In-Depth Consideration of Hazards and Effects as Revealed in Survey Data* (Massachusetts Institute of Technology, Center for Policy Alternatives, September 1979) for a detailed full report on the study.

[3] The following injury and illness rates for manufacturing have been computed by the Bureau of Labor Statistics:

1969, 14.8; 1970, 15.2; 1972, 15.6; 1973, 15.3; 1974, 14.6; 1975, 13.0; 1976, 13.2.

Rates for 1969 and 1970 are frequency rates, and are not strictly comparable with figures for later years, which are incidence rates. Although these data indicate a modest decline in work-related illness and injury, it should also be noted that the lost workday case rate rose steadily over the same period.

[4] Frenkel and Priest, *Health, Safety and the Worker*, p. 81. The following injury rates for production workers were computed:

Male	1969—.2177	1972—.2628	1977—.2882
Female	1969—.1212	1972—.1139	1977—.3179

These rates represent the total number of injuries experienced by workers in the 3 previous years, divided by the total number of workers. Thus, the annual injury rate equivalent may be computed by dividing by 3.

[5] In 1969, the 100 female production workers reported 12 injuries, and in 1972, there were 13 injuries for 115 women. But in 1977, the 101 female production workers reported 32 injuries.

[6] Significant at the 10 percent or better level.

[7] Others have noted the problem of subjective bias. See Daniel Hamermesh, "Economic Aspects of Job Satisfaction," *Essays in Labor Market Analysis*, Orley Ashenfelter and Wallace Oates, eds., (New York, John Wiley & Sons, 1978).

[8] See Nicholas A. Ashford, *Crisis in the Workplace: Occupational Disease and Injury* (Cambridge, Mass., The MIT Press, 1976), pp. 107–13, for a discussion of accident causation studies.

[9] The rate for low-tenured workers is biased upwards because they may have changed jobs subsequent to, and because of, injury.

[10] Corrected for age.

[11] The figure is approximately 5.6 percent when limited to union workers, and lower, of course, when all workers are considered.

[12] See also "On Trial: A Union's Fairness," *Business Week*, Aug. 13, 1979, p. 76.

[13] We wish to express our appreciation to the Office of Management Data Systems of the Occupational Safety and Health Administration for providing these data in machine readable form.

[14] The Quality of Employment Survey provided a convenient, but not very suitable, vehicle for investigating this relationship. The question is better suited to aggregate firm data. However, these results do contrast with the intent of the Schweiker Amendment to exempt establishments of 10 or fewer employees in selected SIC coded industries. The presumption in that amendment is that SIC coded industries with low injury rates should be exempted because their injury rates are low. However, this presumption ignores the possibility that although injury rates may be lower in some industries than others, the opportunity for improvement in reducing injuries and fatalities may be greater in some of the lower injury rate industries, especially if these industries are dominated by smaller firms.

Geographic wage indexing for CETA and Medicare

The tailoring of grants-in-aid to wage levels in the localities which receive them enjoys growing popularity among Federal policymakers; two ongoing programs illustrate the flexibility of this technique

RICHARD GREENE

During the 1970's, a goal of Federal domestic policy was the direction of aid packages to specific geographic areas and groups of people. Federal grants-in-aid to State and local governments rose from $10.9 billion in 1965 to an estimated $88.9 billion during fiscal 1980. This new approach to managing the economy considerably altered the relationship between the Federal government and State and local governments and created a strong demand for accurate and timely information on the economic conditions in States and smaller areas.

Local statistical indicators are vital to effective policy formulation and evaluation and, in a narrower sense, are the primary requisite for identifying and directing assistance to economically distressed areas. In fiscal 1979, more than $19 billion in Federal aid was allocated on the basis of the BLS program Local Area Unemployment Statistics, and an additional $20 billion was distributed through programs based on the Bureau of Economic Analysis' State and substate data on personal and per capita income. And, growing numbers of multi-establishment employers—both private and public—are using area wage determinations to establish appropriate pay structures for employees in diverse locations.

Recent congressional action on the Comprehensive Employment and Training Act reauthorization and the jobs component of welfare reform, regulations issued or under study by various Federal agencies, and the Administration push to tie Federal pay scales to local wage levels indicate acceptance of the concept of geographic wage indexing by national policymakers. Use of the procedure in Federal grant programs is largely the result of congressional interest in finetuning grant-in-aid allocation formulas. At the same time, the expansion and refinement of an important administrative record system—the ES–202 program—has made a body of data available to support index development.

Obviously, the amount of financial assistance needed to operate a given program varies by locality. The goal of geographic wage indexing is to produce a more efficient funds allocation system by accounting for differences in local labor-market conditions. According to the 1978 CETA reauthorization, wage indexing is a tool to "provide the maximum number of employment and training opportunities under this Act."

Proper construction is especially important for a geographic index used to distribute Federal funds. The chief problem in developing such an index arises from the fact that people travel to work across political boundaries; that is, labor markets do not conform to political boundaries. Consequently, for many jurisdictions, a place-of-residence index will differ substantially from a place-of-work index. Other major variables involved in index design are summarized as follows:

Richard Greene is a labor economist in the Office of Employment Structure and Trends, Bureau of Labor Statistics.

Variable	*Examples*
Geographic area	Region, State, Standard Metropolitan Statistical Area, city, county, and prime sponsor
Type of worker	All employees, nongovernment, service producing, medical services, hospital
Type of data	Annual average wage, average weekly wage, average hourly earnings
Type of index	Place of work, place of residence
Reference period	Year, quarter, month, week

This article describes the procedures currently used to index the Federal CETA and Medicare programs, and their data source, the ES–202 system. The indexing techniques for both programs are very straightforward; each index is simply the ratio of a specific locality's wage level for a particular segment of the labor force to that segment's national wage average and is based on a place-of-work concept. An index value greater than 1 indicates that area wages generally exceed the national average, and the Federal program's disbursement level is adjusted accordingly.

The data source

The ES–202 program compiles information on the employment of, and total wage payments to, workers covered by unemployment insurance (UI). Each calendar quarter, all UI-covered employers submit mandatory reports of employment and wage data to the appropriate State Employment Security Agency. These reports are edited, summarized by county, State, and detailed industry, and forwarded to the Bureau of Labor Statistics, which computes national totals. Among the final products of the system are monthly employment and total quarterly wages by county, State, detailed industry, type of employer (Federal, State and local government or private sector), and (for the first quarter) employment size of establishment.

In 1978, UI coverage was extended to employees of State and local governments. Thus, the ES–202 program now provides a virtual quarterly census of the employment and wages of all nonagricultural sectors of the economy. (A significant portion of agriculture was also covered for the first time beginning in 1978.) Because of their broad scope, UI data provide a means to evaluate overall labor-market trends and industry developments for the Nation as a whole and for individual States, Standard Metropolitan Statistical Areas, and counties. The data are used in the construction of major statistical series, including the U.S. Department of Commerce's national income accounts and personal income estimates by State and county, and to benchmark employment information for Federal and State government surveys. The employer listings maintained by this system also serve as a sampling frame for most establishment studies conducted by BLS.

CETA wage adjustment index

The 1978 Comprehensive Employment and Training Act (CETA) Amendments require the calculation of an area wage adjustment index, showing the relationship between the local and national average wage rates. Specifically, this index is used to determine: (1) the average annual federally supported wage rate which must be maintained in each CETA prime sponsor area[1]; and, (2) the maximum wage payable to any Public Service Employee (PSE) from CETA funds.

Each year, BLS prepares the CETA wage adjustment index, in accordance with the requirements of the Employment and Training Administration. The index for fiscal 1980 was published in the *Federal Register* on September 28, 1979.

Index calculation. The first step in calculating the CETA wage adjustment index is computation of the average annual wage for each county. This is defined as the ratio of total wages paid during the previous calendar year to average monthly employment for that year. Approximately 6 percent of CETA prime sponsors represent combinations of counties or of portions of counties. In such cases, the sponsor's annual average wage is the mean of the component counties' annual wages after the latter have been weighted by the proportion of the sponsor's employment which they represent. In those instances in which more than one prime sponsor is contained entirely within a county (Los Angeles County, for example, wholly contains 5 prime sponsors), each prime sponsor is assigned the annual wage for the coun-

Exhibit 1. CETA index calculation[1] for Cleveland City prime sponsor (Cuyahoga county)

Annual average county employment (Emp) = 762,766

Total annual county wages (TW) = $10,846,322,430

County average annual wage = TW/Emp = $14,220

$$\text{CETA Index} = \frac{\text{Average annual wage}_{\text{county}}}{\text{Average annual wage}_{\text{United States}}}$$

$$= \frac{\$14{,}220}{\$12{,}144} = 1.171$$

[1] See table 1, footnote 1.

ty as a whole. The CETA index is then determined by comparing the prime sponsor's annual wage to the national average, which was $12,144 in 1978. Exhibit 1 illustrates the CETA index calculation for the Cleveland City prime sponsor, which is wholly contained in Cuyahoga county.

Index values are similarly computed for each prime sponsor, Standard Metropolitan Statistical Area (SMSA), and county with more than 50,000 inhabitants. Prime sponsors may use the index of a component SMSA or county, if higher than their overall index, for that portion of their jurisdiction which is in the higher index locality.

Application. The wage index is used to compute average and maximum wages payable to CETA employees by a prime sponsor. (The most recent index values are based on 1978 data, and are used for wage adjustments made during fiscal 1980.) The construction of a sponsor's average wage takes into account the 1978 legislated national average wage of $7,200, the over-the-year mean percentage change in wages nationwide, and the local area's current-year wage index. For the Cleveland City prime sponsor, the fiscal 1980 average wage would be computed as follows:

- Update the national average wage "base" by adjusting for the over-the-year wage change. The increase in annual wages nationwide averaged 6.3 percent during 1978.

Revised base = ($7,200) (1.063) = $7,654

- Determine the Cleveland City prime sponsor's average wage by adjusting the revised national base by Cleveland's current-year index. (The minimum average annual wage for any sponsor must be at least 10 percent above the annualized Federal minimum wage.)

Cleveland average wage =
(Revised national base) (Current-year index)
$8,963 = ($7,654) (1.171)

The prime sponsor's maximum wage is similarly constructed, except that the national base is $10,000, rather than $7,200. Thus, the maximum wage for Cleveland City was:

Cleveland maximum wage = ($10,000) (Current-year index)
$11,710 = ($10,000) (1.171)

The maximum wage for local areas has a ceiling of $12,000, except for prime sponsors whose average wages are at least 50 percent greater than the national mean—a situation occurring only in Alaska. This upper limit was established to ensure that CETA wages are compatible with the skill levels of the disadvantaged population which Congress intended the program to serve.

According to the current regulations, a prime sponsor's average wage is adjusted each year for overall wage level changes, but its maximum wage is left unadjusted. In the future, this anomaly could result in prime sponsor average wages which exceed corresponding maximum levels. Currently, the average CETA wage is approximately 63 percent of the average annual wage for all workers in an area; the mean potential maximum wage is about 88 percent of the all-worker figure.

Table 1. Average annual wage and CETA index levels,[1] selected SMSA's

SMSA	Average wage	Index
10 highest wage SMSA's:		
Anchorage	$20,363	1.677
Flint	16,917	1.393
Detroit	15,964	1.315
Saginaw	15,715	1.294
Gary-Hammond	15,254	1.256
Peoria	15,149	1.247
Steubenville-Weirton, Ohio	15,058	1.240
Ann Arbor	14,810	1.219
Kokomo	14,754	1.219
Richland-Kennewick, Wash.	14,736	1.213
10 largest SMSA's:		
New York	$14,511	1.195
Chicago	14,217	1.171
Los Angeles	13,604	1.120
Philadelphia	12,739	1.049
Detroit	15,964	1.315
San Francisco	14,135	1.164
Washington, D.C.	14,262	1.174
Boston	12,191	1.004
Nassau-Suffolk	12,134	.999
Dallas-Fort Worth	12,361	1.018

[1] The index determination, based on 1978 data, is used to adjust CETA wage levels during fiscal 1980.

An analysis of the variation among locality indexes is important, because these data directly determine CETA wages. Table 1 presents index levels for the 10 largest and 10 "highest average annual wage" SMSA's. Detroit is the only area appearing on both lists. All of the largest SMSA's are at or above the average annual wage for the United States, and six exceed the national mean by 12 percent or more. Eight of the highest wage SMSA's are located in areas dominated by high-paying steel and automobile manufacturing industries; four of these are located in Michigan.

As the following tabulation indicates, there is a

Table 2. Percent distribution of SMSA's by region and CETA index level[1]

Region	Total	Index value			
		Under .90	.90 to .99	1.00 to 1.09	1.10 and above
United States	100	34	32	20	15
Northeast	100	28	40	21	12
South	100	53	30	13	5
Midwest	100	16	26	29	30
West	100	26	40	19	14

[1] See table 1, footnote 1.
NOTE: Due to rounding, sums of individual items may not equal 100.

strong positive correlation between SMSA population and CETA index value:

SMSA population	*Average index value*
Under 250,000	.930
250,000 to 1,000,000	.974
Greater than 1,000,000	1.065

Larger cities generally have higher overall relative wages because of favorable industry and occupational mix, location factors, labor force composition, and other traditionally cited reasons for area wage differentials. Although only 35 percent of the SMSA's had index values greater than 1, these areas accounted for over 63 percent of the total population in SMSA's nationwide.

Table 2 presents the distribution of SMSA's by wage index and region. Note that in the Midwest a majority of the SMSA's had wages above the national mean. In contrast, averages for more than two-thirds of those in both the Northeast and South fell below the U.S. average.

Medicare

In 1974, the Health Care Financing Administration (HCFA) of the Department of Health, Education and Welfare established a schedule of limits on the hospital inpatient general routine operating costs which may be reimbursed by the Federal Government under Medicare. This procedure limits reimbursable costs to those recognized as reasonable for the efficient delivery of needed health services. Authority to set these reimbursement limits was established by the 1972 Social Security Amendments.

According to estimates of health care expenditures, wages and salaries account for about 60 percent of total inpatient general routine operating costs.[2] In recognition of the interarea differences in hospital labor costs, the Health Care Financing Administration developed a wage index from the ES-202 data to adjust the labor component of the reimbursement limit. In this way, the limit for an individual hospital will reflect the wage levels appropriate to the area in which the hospital is located. The most recent index, based on 1978 data, will be used to adjust limits for hospitals whose cost reporting periods begin on or after July 1, 1980.

As in the CETA program, the hospital wage index is used to adjust an established reimbursement level to the wage structure of the local labor market. But the CETA index is used to adjust the legislated $7,200 national average wage, while the hospital wage index is applied to a reimbursable schedule according to such factors as the location (urban or nonurban) and size of the hospital.

Calculation of the hospital labor cost index. The following discussion summarizes the Hospital Care Financing Administration's procedures described in the April 1, 1980 *Federal Register.* Because the level of reimbursement depends in part upon hospital location, separate indexes are calculated for urban and nonurban areas. Exhibit 2 shows the wage index calculation for a hospital in the Cleveland SMSA.

Exhibit 2. Hospital wage index calculation[1] for the Cleveland SMSA

- Calculate the average hospital wage for Cleveland (W_c):

$$W_c = \frac{\text{Total hospital wages}_{\text{Cleveland}}}{\text{Average annual hospital employment}_{\text{Cleveland}}} = \$11{,}612$$

- Calculate the national average hospital wage for urban areas (UW_{nat}):

$$UW_{nat} = \frac{\Sigma\ \text{(average annual hospital wage for each SMSA)}}{\text{Total number of SMSA's}} = \$9{,}912$$

- Calculate the hospital wage index for Cleveland (I_c):

$$I_c = \frac{W_c}{UW_{nat}} = 1.1715$$

---

[1] See table 3, footnote 1.

There is a major difference between the CETA and health program procedures used to compute the national average wage. The CETA national average is weighted according to the employment size of the component areas, while the hospital wage mean is unweighted. This implies that a large city will have a greater proportional influence on the CETA national wage, but will have the same impact as a smaller-sized city on the health program index.

Exhibit 3. Cost reimbursement procedure for a 500-bed Cleveland hospital

- Determine the labor and nonlabor reimbursement limits: From the schedules appearing in the April 1, 1980 *Federal Register,* the labor and nonlabor reimbursement limits for a 500-bed urban hospital are $94.49 and $26.47 per day, respectively, or $120.76, combined.

- Compute the adjusted labor component:

Adjusted labor component =
(Labor reimbursement limit) (Cleveland wage index)
$110.46 = ($94.29) (1.1715)

- Compute new reimbursement limit:

New limit =
(Adjusted labor component) + (Nonlabor component)
$136.93 = 110.46 + 26.47

Application. Once determined, the hospital labor cost index is applied to the reimbursement limits for individual hospitals. Exhibit 3 illustrates the calculation of the adjusted limit for a 500–bed hospital in Cleveland. Hospitals are also permitted to make other adjustments to their reimbursable limits which do not involve the wage index.

An analysis of the variation among the area indexes reveals some similarities to and differences from CETA patterns. Table 3 presents index data for the 10 largest and 10 highest hospital labor cost indexed SMSA's. An index value greater than 1 indicates that the SMSA has higher hospital wages than the unweighted average hospital wage for all SMSA's. The high-index SMSA's include four of the largest SMSA's in the country, and are dominated by California areas.

The same positive population-to-wage-index correlation observed in CETA determinations occurs with the hospital wage data. Only 45 percent of the SMSA's had labor cost indexes greater than 1, but they accounted for over 71 percent of the total U.S. population in SMSA's. The following tabulation illustrates this tendency of larger cities to have higher hospital unit labor costs.

SMSA population	*Average HCFA index*
Under 250,000	.966
250,000 to 1,000,000	1.021
Greater than 1,000,000	1.119

The regional distribution of SMSA's by labor cost index level (table 4) shows that in both the Northeast and West, approximately two-thirds of the SMSA's have hospital wages greater than the national average, while the South is dominated by low-wage SMSA's. Thus, a comparison of the hospital labor cost and CETA indexes reveals that wage adjustments resulting from the former will tend to be larger in the West and Northeast while the latter will yield larger adjustments in the Midwest.

Table 3. Hospital labor cost index levels,[1] selected SMSA's

SMSA	HCFA index
10 highest index SMSA's:	
Vallejo, Calif	1.54
Anchorage	1.52
New York	1.45
Oxnard, Calif	1.41
San Francisco	1.38
San Jose	1.38
Santa Rosa, Calif	1.32
Nassau-Suffolk	1.31
Stockton, Calif	1.30
Los Angeles	1.29
10 largest SMSA's:	
New York	1.45
Chicago	1.22
Los Angeles	1.29
Philadelphia	1.16
Detroit	1.18
San Francisco	1.38
Washington, D.C	1.28
Boston	1.14
Nassau-Suffolk	1.31
Dallas-Fort Worth	.94

[1] The index determination, based on 1978 data, is used to adjust reimbursement levels for hospitals whose cost reporting periods begin on or after July 1, 1980.

Table 4. Percent distribution of SMSA's by region and hospital labor cost index level[1]

Region	Total	Index			
		Under .90	.90 to .99	1.00 to 1.09	1.10 and above
United States	100	16	29	39	16

Summary

The practice of adjusting Federal compensation according to an area's relative pay level is rapidly gaining acceptance among designers of Federal grant programs. Although similar in concept, the mechanics underlying the calculations of the two wage indexes described in this article vary according to the goals and limitations of the authorizing legislation. For example, the hospital wage index is based only on data for hospital employees because studies indicate that the wages of other groups, particularly the "total service" sector, do not properly reflect pay levels in hospitals.[3] The CETA index, however, is based on the wages of all non-CETA employees, because there are no restrictions on the types of industries in which CETA workers may be employed. (Traditionally, however, most CETA workers have been hired by State and local governments.)

The other major difference between these indexes is in the calculation of the national average wage, the base to which the area pay levels are compared. In order to maintain the $7,200 average wage (in fiscal 1979 dollars) nationwide established by the 1978 CETA Amendments, the program's national average is weighted by the employment of the component counties, and thus largely reflects the average wages of larger cities. But because the intent of the Health Care Financing Administration is merely to effect a labor-cost adjustment, independent of area employment size, that agency relies on an unweighted national average which treats each area's average hospital wage equally, regardless of total area employment. ☐

———*FOOTNOTES*———

[1] CETA programs function principally through prime sponsors—the States, cities and counties of 100,000 inhabitants or more, and combinations of such areas. There were 473 sponsors in fiscal 1980.

Industrial relations research: an agenda for the 1980's

An organized effort is needed to fill critical gaps in our understanding of the collective bargaining process, and this calls for renewed academic interest in the study of industrial relations

THOMAS A. KOCHAN

Is industrial relations today attuned to the needs of the 1980's? Because a good deal of evidence says "no," a group of practitioners has designed a research effort to reverse the perceived decline. This article casts these proposals into an agenda for industrial relations research for the next decade.

The nature of the decline

In recent years, two central criticisms of industrial relations research have been offered by a variety of researchers: (1) linkages among researchers, policymakers, and practitioners were more common previously, but have eroded in recent years, and, (2) research on labor-management relations has not kept pace with general theoretical and methodological developments in the social sciences. As a result, research is not adequately meeting the demand for informed policy analysis.[1]

Four interrelated causes of these developments have frequently been cited. First, the number of researchers in the field has declined since the time of the National War Labor Board. Most of the labor economists trained in the 1960's and 1970's specialized in labor market economics, human resource policy, or other areas in which abundant funding was available, and which allowed more direct use of economic theories and econometric techniques. Similarly, persons with stronger interest in the behavioral sciences entered the expanding fields of organizational behavior and development, and generally abandoned the study of collective bargaining and labor-management relations.

Secondly, since 1960, public labor policy has drifted toward more direct governmental regulation of the terms and conditions of employment, with little regard for the role of collective bargaining. Direct regulation appeared necessary to achieve some labor policy objectives, because neither collective bargaining nor the competitive market had produced the results desired by society in such areas as equal employment opportunity, occupational safety and health, pension security, and wage and price stability. However, there is a growing recognition of the limits of direct regulation, and the problems that gave rise to such laws will continue to be of critical concern to labor, management, and the public during the next decade. Thus, the 1980's should be a time to test the ability of unions and employers to address public objectives through collective bargaining relationships.

Thirdly, the U.S. Department of Labor has shifted priorities to its growing regulatory responsibilities and expanding employment and training programs at the expense of labor-management relations research, policy development, and services. Less than 7 percent of the budget of the Labor Management Services Administration, the organization with primary labor relations responsibilities, and less than 1 percent of the Labor Department's total budget, is currently allocated to activities designed to improve labor-management relations.

Finally, relations between labor and management in

Thomas A. Kochan is a professor of industrial relations at the Massachusetts Institute of Technology.

the private sector have polarized in recent years. During the 1970's, many employers devoted more resources to opposing union organizing efforts than to improving their collective bargaining relationships. Over the same period, union membership in the private sector declined, and labor became defensive of its status in society and industry. This polarization limited the bilateral development of new approaches for dealing with common problems at the workplace.

One result of the deterioration of labor-management relations was the political stalemate between business and labor, which impeded congressional passage of labor legislation, whether backed by labor or business. Policy development on labor issues, therefore, is currently at a standstill.

General directions for research

In order to redirect and revitalize the study of industrial relations, a research agenda for the 1980's was developed by the Department of Labor and a number of scholars in the field. Four points drawn from recent research critiques formed the basis of the agenda:

- A richer blending of institutional and quantitative methods should be achieved.
- More attention should be paid to the organizational behavior and functioning of micro institutions —firms and union locals—and to their implications for macro performance.
- Research should measure the actual impacts of practices, laws, and bargaining agreements on the goals of the parties, rather than limiting itself to description of the anticipated results.
- Research findings should be disseminated more effectively to interested professionals in the field.

The specific research topics included in this agenda reflect the labor policy issues likely to be most critical in the 1980's.[2]

The outcomes and effects of bargaining

Two types of research on bargaining outcomes are needed. The first would investigate the current effects of collective bargaining on the terms and conditions of employment, and on public policy objectives. The second would evaluate the costs and benefits of specific experiments (or demonstration projects) designed to improve the performance of bargaining. In short, we need to describe all pertinent aspects of the industrial relations scene, and then measure the effect that change in any one aspect would have on the collective bargaining process.

Determination of wages and economic benefits

Wage determination. Over the past two decades, most wage research has taken one of two forms: (1) aggregate wage adjustment models, or (2) analysis of union-nonunion differentials for individuals, occupational groups, or industries. However, a well-conceived and tested model of the wage determination process at the level of the bargaining unit has yet to be developed. This is unfortunate, because effective public policy must be based on such a theoretically sound and empirically verified model.

For example, most incomes policies make certain assumptions about the effects of pattern bargaining across major bargaining units, industries, and geographic areas. (Pattern bargaining is the determination of the terms of union contracts according to the precedent set by an agreement previously negotiated by another union local or firm, or in another locality.) Some analysts believe pattern bargaining exerts a very strong effect, while others discount its importance in wage determination. An assessment of its true impact requires analysis of specific wage and fringe benefit changes in identifiable firms or bargaining units.

Pattern bargaining is only one key variable chosen here to illustrate the need to study the ways in which characteristics of a particular bargaining relationship and its external environment determine the results of the negotiating process. Other factors, such as the formal bargaining structure, strikes, and union and employer expectations and wage targets, should also be included in models which attempt to explain variations in the outcomes of negotiation at the bargaining unit level.

Fringe benefits. Difficult choices face unions and employers in the area of fringe benefit bargaining. For example, as the ratio of retired persons to the work force increases over the next 20 years, the costs of funding pension plans will grow considerably. And, if inflation continues, conflicts concerning the adequacy and funding of private pension plans will be even more intense. Questions regarding the control and use of pension funds, the relationship between private funds and the social security system, and the vesting and portability of pensions, require cautious examination by researchers skilled in demographic and financial analysis. Demand for professionals with expertise in financial management, funding of fringe benefits, and the simulation of costs and advantages of alternative benefit packages is likely to increase considerably as a result. Clearly, the area of compensation management should take on added importance in the training of industrial relations professionals.

Nonmonetary bargaining

A number of recent studies have examined the determinants of nonmonetary provisions of bargaining agreements. In the future, similar efforts should probe the relationship between monetary and nonmonetary outcomes, and identify reasons for and the effects of the spread of various nonmonetary provisions among firms and industries. This type of research permits assessment of the ability of the private bargaining system to address public policy or regulatory concerns.

Safety and health. Following passage of the Occupational Safety and Health Act in 1970, contract safety and health provisions proliferated. However, there has been no systematic study of the relationship of these provisions to the safety and health conditions in the firms involved, or to the injury and illness experience of covered workers.

Such studies are essential groundwork for any experiments which seek to use collective bargaining to address safety and health problems. For example, more than 40 percent of all agreements covering 1,000 workers or more currently provide for a union-management safety and health committee. A starting point for this type of research might be a study of the effectiveness of these committees. The job safety issue offers an important opportunity to test the ability of the collective bargaining system to achieve labor policy objectives.

Job security and dislocation. As with safety and health, the central policy questions regarding job and income security provisions in union contracts are twofold: (1) what factors influence the spread or the comprehensiveness of such provisions, and, (2) how do these provisions affect the goals of workers, employers, and the public?

The job security issue has not been seriously addressed since the controversies surrounding automation and technological change during the 1960's. However, recent plant shutdowns, and international trade policy shifts, as well as industry deregulations and other government actions, are reviving discussion. There are currently a number of *ad hoc* public programs dealing with economic dislocation effects, including those established by the 1978 Redwoods National Park Act Amendments, the Regional Rail Reorganization Act (1973), and the Trade Adjustment Assistance Amendments (1974). Research in the 1980's must quantify the problems of economic dislocation, and evaluate alternative solutions, based on an appropriate balance of public and private efforts.

Productivity. The effect of collective bargaining on productivity has been a longstanding concern in industrial relations, but has generally defied rigorous research. The sluggish growth in productivity experienced over the past decade has once again alerted government officials to the importance of this issue. The Federal Government lacks a successful strategy for encouraging productivity improvement through union-management relations; results of attempts to link productivity to wage guidelines have been ambiguous. Similarly, "productivity bargaining" (agreements that buy out outmoded work rules) and various profit sharing programs are employed from time to time by unions and management, but the outcomes of such efforts have not been systematically evaluated.

The recent work of James L. Medoff, Charles Brown, Richard B. Freeman, and their colleagues suggests that the nature of the labor-management relationship itself has a significant effect on productivity.[3] Their findings lend empirical support to what has traditionally been labeled the "shock effect" hypothesis; that is, that the presence of a union (or a negotiated increase in wages or other components of labor costs) provides an incentive for management to become more efficient. What is not yet well known, however, is the nature of the managerial adjustments, and the characteristics of the labor-management relationship, which influence productivity. Thus, we need to examine more closely the determinants of successful productivity increase.

Quality of worklife. Because the quality of worklife was the subject of heated debates in the early 1970's, several experiments with new forms of work organization were implemented. As a result, behavioral scientists were introduced to the collective bargaining system, bringing with them strategies to change organizational practices within union-management relationships. This is an encouraging sign that the knowledge gaps among behavioral scientists, industrial relations researchers, and practitioners are being narrowed. The experience gained in these experiments taught important lessons about the obstacles that must be overcome if change is to be successfully introduced into union-management relations via jointly planned programs that supplement the formal collective bargaining process. Attempts to extend the application of behavioral strategies should build on the lessons from these programs. During the 1980's, similar efforts in unionized settings may increase the responsiveness of our collective bargaining system to the needs of individual workers and employers.

Improving labor-management relations

Research in the field of industrial relations failed to keep abreast of changing characteristics and policies of unions and employers during the 1970's. Research in the 1980's, therefore, should seek to update our knowledge of the structures, policies, practices, and internal dynamics of union and management organizations. Specific union and management characteristics and behaviors must then be evaluated for their impact on the process of bargaining, its outcomes, and the goals of all concerned, including society as a whole.

Management organizations. In 1960, a comprehensive study of the collective bargaining policies and practices of management was published by Sumner Slichter, James J. Healy, and E. Robert Livernash, under the auspices of the Brookings Institution.[4] In subsequent years, however, management researchers turned their attention to the growing fields of organizational behavior and human resource management, and away from union-management topics. As a result, few personnel and organizational behavior researchers currently are experienced in collective bargaining issues.

A start has already been made in closing the gap in our understanding of current management structures, practices, and policies. The Conference Board recently conducted a broad ranging survey of the labor relations structures, goals, and priorities of a sample of the largest unionized companies in the private sector.[5] Data from this survey provide a basis for further studies relating these (and other) management characteristics to industrial relations and economic performance.

American management has a history of strong opposition to the unionization of its employees. The Conference Board survey clearly documented that this is still the dominant labor relations objective of nonunion firms. Preventing the growth of unions was also found to be a high priority of firms with a minority of their employees currently organized. Anti-unionism receives a low priority among highly organized companies. What are the long-run costs and benefits of strong management resistance to unionization? How does it affect the climate of labor-management relations, the economic performance of the firm, and the welfare of individual workers? We need to address the controversial and extremely important issue of the effects of alternative management policies toward unions and collective bargaining on the economic interests of firms, individual workers, unions, and the public.

Union organization. The study of unions as complex organizations is also beginning to reemerge after more than a decade of decline.[6] Recently, a number of studies have appeared on such subjects as union democracy, effectiveness in bargaining, member participation, attitudes of workers towards unions, propensity of workers to join unions, and the organizational structure of unions. Future research should yield a basic understanding of the representational and administrative functions of modern unions, the criteria by which members evaluate the performance of their leadership, and the way in which the internal structure of individual bargaining units affects negotiation.

Unions face a number of critical organizational challenges in the 1980's, the most obvious of which is reversal of the decline in organization of the labor force. Clearly, a study of the causes of change in union penetration demands an important place in our research agenda. Careful historical analysis of the labor movement will help to explain recent trends, and predict future developments.

An equally important challenge to labor lies in maintaining the responsiveness of local and national union officials to the interests of rank-and-file members. While data from the 1977 Quality of Employment Survey showed that unions are generally attuned to the priorities of their members, the respondents also indicated that they would like to see improvement in the administrative performance of the local union (that is, better handling of grievances, more feedback on local union affairs, and more member involvement in union decisions).[7] These preferences, coupled with increased government regulation of the terms and conditions of employment, and the growing complexity of union contracts, suggest that the administrative functions of local unions will take on added significance in the coming years. This will be especially true if there is to be more experimentation with union-management committees or other mechanisms for introducing public policy changes to the workplace. Study of the administrative functions and performance of local unions should therefore be an important priority for research in the next decade. Special care should be taken to ensure that this research is translated into labor education and training programs, so that it may have a direct effect on practice.

Strikes and dispute resolution. Research on the role of strikes, lockouts, other forms of economic pressure, and alternative procedures for resolving interest disputes is vital to an understanding of the collective bargaining process. Analysis of the alternatives for dealing with strikes which threaten national health and safety featured prominently in industrial relations research in the 1950's and 1960's, but interest in this issue waned considerably in the 1970's. Apparently most researchers believe that society benefits most from very limited use of emergency dispute procedures. The question of the appropriate policy for the Federal Government in dealing with strikes that affect the national interest deserves an important place in our research agenda, regardless of its immediate political significance.

Experimentation with a wide variety of third party procedures for resolving labor-management disputes blossomed in the 1970's. Most of the attention was directed toward studies of mediation, fact-finding, and arbitration in the public sector, but a number of private sector experiments, most notably the Experimental Negotiation Agreement in the steel industry, also stimulated interest in the subject. Furthermore, third parties are assuming such additional roles as expert consultants to, or coordinators of, labor-management committees. We need to learn more about the nature and effectiveness of third party roles, and to find ways to implement both well-established and newer forms of conflict resolution and problem solving within the context of a complex modern society.

Grievance procedures and arbitration

Grievance arbitration has been cited as one of the most successful innovations that the American system of collective bargaining has contributed to the conduct of industrial relations.[8] Grievance procedures ending in arbitration became common in union contracts because both labor and management saw them as efficient and equitable means for interpreting and enforcing the collective bargaining agreement. However, the apparent fairness of grievance and arbitration has discouraged research on the actual performance of the system. Furthermore, pressures caused by delays, excessive costs, and legal technicalities raise profound questions about the future viability of the formal grievance procedure and arbitration as it is now practiced. Conventional views on grievance arbitration therefore merit careful evaluation, supported by empirical research.

Beyond proposing changes in current practices, research on grievance procedures should ask fundamental questions about the real impact of this institution. So much emphasis has been placed on the arbitration process itself that we have failed to adequately assess the effects of the decisions on the parties. For example, how do arbitration awards affect the subsequent behavior of the employers, individuals, and unions involved? What happens to workers reinstated in their jobs? And, do arbitration decisions result in more than a temporary modification of the behavior that brought about the grievance? We should no longer be satisfied to leave the study of arbitration at the point at which the decision is rendered.

Another basic assumption about grievance procedures is that they are the cornerstone of the contract administration process—the means by which workers enforce their contractual rights. Yet, we have very little data on just how individual workers perceive the operations and results of the formal grievance procedure. The need for empirical evidence on the performance of grievance procedures and arbitration is especially important if these provisions for adjudicating disputes are extended beyond rights provided by the bargaining agreement to include rights derived from public laws.

Public sector labor-management relations

Many of the theoretical and methodological advances in industrial relations research in the 1970's arose from public sector studies.[9] These studies were generally limited to description and intensive analysis of the effects of specific public policies within particular States and areas. The next step in research will be the application of methodologies and theories developed in the single area studies to interarea variations in policies. This type of data and analysis is needed by policymakers at every level who must evaluate existing laws or consider the enactment of new legislation.

Public sector bargaining offers the largest arena for observing the long-run consequences of bargaining systems that place varying priorities on avoiding work stoppages. An understanding of the positive and negative consequences of these alternative systems should therefore be a basic component of our approach to industrial relations in the 1980's.[10]

Policy formulation and administration

The signing of the National Accord in 1979 rekindled interest in group participation and consultation in the formulation of labor and economic policies. The same question is confronted periodically at the State level, most notably when pressures arise for changes in the bargaining rights of State and local government employees. Today, this issue has added importance because of the apparent political stalemate over labor policy afflicting the Federal Government. Thus, the policy formulation process is an important topic for research in the 1980's. Such research might focus on the "political economy"—the relationships among the major actors and interests in society as they affect political and economic activity. A more action-oriented approach would be the establishment of multilateral study commissions on key policy issues to test the effectiveness of cooperative policy development.

Furthermore, there is a need for the experimental use of arbitration or other procedures to reduce the backlog of cases in administrative agencies such as the Occupational Safety and Health Administration, the Equal Employment Opportunity Commission, and the National Labor Relations Board. More intensive study to assess the performance of these agencies could identify the nature of the problems they are experiencing, and provide innovative strategies for overcoming them.

Comparative research: the broader picture

Researchers should not lose sight of the broad political, philosophical, and normative ideas underlying our economic system. One way to ensure that these concepts receive adequate attention is to maintain a strong international and comparative component to industrial relations research.

Some questions suitable for study:

- When is employee ownership a viable form of industrial organization? Should it be promoted as an alternative to plant shutdowns? Should it be promoted in other situations as well?
- Can European style formal systems of worker par-

ticipation in, and control over, firm decisions work effectively in the United States?

- What is the appropriate role for the U.S. Government in the International Labor Organization and similar international bodies?
- What are the implications of adopting a more formal "social contract" system for formulating labor and economic policies in the United States?
- Is the pluralistic model of society upon which the U.S. industrial relations system is based still a valid normative model for guiding policy, research, and practice?
- What is the effect of multinational corporations on industrial relations in the United States, and conversely, what are the economic and social effects of American multinationals in their host countries?
- What are the implications of the increased activities of international union secretariats? Will transnational bargaining become a reality in the 1980's?

Studies of industrial relations developments, public policies, and private practices in other countries may provide alternatives for dealing with many of the issues discussed in earlier sections of this article.

BETTER RESEARCH cannot ensure that the 1980's will be a decade of resurgence, experimentation, and improved performance in our industrial relations system. Yet, it is a necessary and important component of the larger strategy that must be undertaken if labor-management relations policies and practices are to make significant contributions to the economic and social challenges that face our Nation in this decade. □

[10] A longstanding problem in the public sector has been the lack of adequate data on wages, benefits, and contract provisions covering State and local government employees, and on the financial conditions of their employers. Most State statutes require factfinders and arbitrators to take comparability and ability to pay into account in rendering their recommendations and awards. A study of the data needs in public sector bargaining, under the title of "Data Probe 80," is currently being conducted under the direction of Robert D. Helsby and Ronald A. Leahy of the Public Employment Relations Service, Albany, N.Y.

Communications

Do uncertain cost/benefit estimates prolong public-sector disputes?

PAUL F. GERHART AND JOHN E. DROTNING

During 1978–79, we conducted a study to investigate the relative effectiveness of impasse procedures (statutory and de facto) in six States—Iowa, Michigan, New York, Ohio, Pennsylvania and Wisconsin.[1] The States were selected, in part, on the basis of the types of procedures used and the experience of the parties with the procedures. In-depth interviews were conducted in 111 bargaining units of 54 municipal and school employers. Interviews included a discussion of the most recent round of negotiations and the factors contributing to whether or not the parties came to an impasse or utilized any impasse procedures.

The study did not rely on extensive statistical data or random selection to draw statistical inferences. Rather, cases were selected purposefully. In each State, bargaining units which had frequently relied on impasse procedures were compared with units where little or no use had been made of such procedures. Interviews with union and management negotiators as well as neutrals who may have been involved allowed an in-depth exploration of the reasons for the observed bargaining relationship between the parties.

Contrary to a traditionally accepted hypothesis,[2] it appears that the parties in public-sector bargaining are more likely to push disputes on to the terminal step of an impasse procedure—whether compulsory arbitration or a strike—the greater their uncertainty about future costs and benefits of continued bargaining.

Uncertainty is behind the general phenomenon that impasses appear to increase and subside soon after a public-sector bargaining law is passed.[3] This may be because inexperienced negotiators are not able to anticipate opponent reactions nor properly assess what lies ahead if settlement is not reached. Alternatively, the rise in impasses immediately following a bargaining law may be related to the added "power" the public unions gain through the statute. If a new law increases union bargaining power, then bargaining outcomes will vary substantially from the mean as the parties search for a new equilibrium point that reflects the new power balance.

Economics of continued disagreement

An effective impasse procedure raises the cost to at least one of the parties of continuing to disagree and, perhaps, at the same time, lowers the cost to the other party of agreeing voluntarily. Under the traditional view, additional uncertainty about the future would increase the parties' costs of continued disagreement. Therefore, it is necessary to consider these costs before discussing how the expected cost is changed by the enactment of impasse procedures. However, both costs and benefits flow from continued disagreement:[4] the process cost to each party and the incremental improvement in outcome benefit to each party.

Process cost. For the union, this includes the cost of lost wages, strike benefits, and other similar monetary costs. Where the strike is prohibited and mandatory arbitration is part of the procedure, the process cost of continuing to disagree includes the cost of the neutrals and advocates used. Even before the parties reach the terminal step of the negotiation process—strike or binding arbitration[5]—there is a cost of continuing to disagree involved in negotiator time. In many cases, this is a cost to the union in terms of forgone leisure or lost earnings for union negotiators which is not insignificant where the union is too small to afford a full-time staff. Earnings may be lost from the public-sector job, but more often they become a factor where "moonlight" jobs are affected. For firefighters this is highly significant. We have found that management engages in a strategy of "wearing down" union negotiators, clearly recognizing that such a tactic is a feasible way to win settlement short of the terminal step in the impasse procedure. Delay has thus become a significant factor in a union's decision to "agree now and avoid delay" in receiving wage and benefit improvements.

Thus the process cost of continuing to disagree is nearly always a "net cost" for unions; on rare occasions, a strategy of continued disagreement may represent a net gain for unions.[6]

Paul F. Gerhart is associate professor of industrial relations and John E. Drotning is professor of industrial relations and Head, Division of Industrial Relations, Case Western Reserve University.

For management, process costs might be calculated by the ability to bear the political cost of strikes. In every strike situation we studied, management gave careful consideration to public reaction to the strike. Public employers also incur the cost of outside negotiators, and delays mean larger fees for the "hired gun." However, the cost of outside experts relative to the agreement costs may be small. Thus, public employers usually overlook or ignore these costs in deciding whether to continue to disagree.[7] But the absolute costs of outside help are not insignificant. We found several employers who spent in excess of $50,000 on outside negotiators in one round of negotiations. Even in a moderately large city or school district, this could make possible a fringe benefit or an increase in the wage rate.

Management, more often than the union, may achieve a net gain by dragging out the negotiating process. As long as a strike does not occur, management continues to function without any increase in costs resulting from a new bargaining agreement. Moreover, the agreement ultimately reached may not include retroactivity so that the settlement actually becomes much cheaper for management because of its delay. Even where retroactivity is included, the delay in reaching an agreement is a gain for management because of the time value of money—which includes more than risk-free interest in the public sector. Delaying a tax increase may mean the difference between winning or losing an election. Furthermore, there may be political gains for management negotiators who "hang tough" at the bargaining table. In no instance can a public negotiator afford to give his constituency the impression that he has "caved in" to the union too quickly.

Outcome benefit. This is the incremental improvement between the final outcome of negotiations following a strike or binding arbitration and the best real offer by the opponent prior to the final outcome. We use the phrase "real offer" to distinguish it from public or formal offers at the bargaining table.

Where disputes went to the terminal step, only rarely did we find that such public offers represented the best offer a party was willing to make.[8] Ordinarily, parties which push a dispute on into the terminal step of an impasse procedure expect the incremental benefit to be positive. Incremental benefits can be, and usually are, positive for both parties simultaneously, for an arbitrator usually issues a binding award which lies between the best real positions of the parties.

We also observed two instances where the incremental benefit was negative for one of the parties; that is, the final outcome was worse than the best real offer of the opponent. Both of these cases involved the use of arbitration rather than the strike; one occurred in Pennsylvania under conventional arbitration and one in Michigan with last-offer-by-issue arbitration. A negative incremental benefit is possible because the parties almost universally employ the "pull back" tactic. That is, the stated position before an arbitrator is not as favorable to the opponent as the best real offer.[9] Management typically makes a wage offer before an arbitrator below what it was willing to offer, and perhaps did offer privately, prior to the arbitration hearing. The union, typically, does the opposite. Either party will raise issues on which it had previously made concessions and even reached agreement.[10]

Where final-offer-by-package arbitration is used (Wisconsin), the use of the pull back tactic guarantees that one party will suffer negative incremental benefits. The arbitrator cannot engage in issue or package splitting so one party's position on every issue must be adopted. Interestingly, we observed no instances of the "pull back" in Wisconsin.

Finally, it is possible that incremental benefits might be negative for both parties simultaneously. This is possible where an arbitrator, faced with multiple issues, awards outcomes in such a way that both parties perceive the final outcome as worse than what the other had offered in negotiations.[11] Interestingly, package last-offer arbitration prevents both sides from losing simultaneously.

We found no instance where both sides became worse off simultaneously, even though it is popular for neutrals to threaten the parties that this might happen. Arbitrators seek to write acceptable awards. At a minimum, this is one in which both sides reap a nonnegative incremental benefit. Thus, it would require greater misjudgment than even the least skilled arbitrator possesses to achieve an outcome where both parties suffer negative incremental gains.

Sources of uncertainty

As noted earlier, when the components of the process cost and the incremental benefit of agreeing were unknown and largely unpredictable, parties most frequently preferred to continue to disagree. Some sources of the uncertainty that appears to generate such a response are the role of the judiciary in handling strikes, the developing nature of various compulsory arbitration procedures, and the public reaction to strikes.

The judicial response to strikes. The most general legislated response to strikes in the public sector is one where the strike is illegal but the penalties are unclear. Next most common is legislation mandating penalties, as in New York and Ohio. Finally, Pennsylvania, among the six States in our study, permits strikes only under certain conditions. Regardless of the legal status of strikes, we found that the treatment of them by the courts varied substantially within some jurisdictions.

Only after considerable experience in Michigan and Pennsylvania do the parties now have the ability to predict judicial responses. In Ohio, such a prediction is still not possible.[12] In New York, Wisconsin, and Iowa, however, the courts acted swiftly and with uniformity (within each of the jurisdictions) concerning strikes, so that the parties were able to predict that element of the process cost of continuing to disagree.

A more common uncertainty concerning judicial reaction concerns whether a judge will enjoin a strike. Judges throughout the six States, but particularly in Pennsylvania, Ohio, and Michigan, were found to be notorious for their attempts to mediate disputes in chambers after an employer had sought an injunction. (Although strikes are legal in Pennsylvania, provided all procedures are followed, they can nonetheless be enjoined where a judge finds a threat to the public health, safety, or welfare.)[13] In one Scranton, Pa. school strike, a three-judge panel heard a request by the school board for an injunction, ordered a settlement, and set the terms.[14] If such a pattern of judicial involvement had persisted in Pennsylvania, the uncertainty concerning judicial action would have remained quite high. What has happened, however, is that judges have tended to show much greater restraint; a consistent pattern has developed.

Compulsory arbitration. The case for uncertainty generated by arbitration may be more difficult to make, particularly in a room filled with arbitrators. Fortunately, we are not attempting to make the case that arbitrators have any uncertainty, only the parties.

The "new toy" hypothesis is one for which we found some support in nearly every jurisdiction we visited. The natural inquisitiveness of the parties, particularly the union, leads them to want to try out a new tool such as arbitration, "just to see what we can get." A more serious characterization of a union's reaction to new legislation is the "new weapon" hypothesis. The result is the same, though. The union will push more disputes into arbitration even if management is responding with "reasonable" offers.[15] However, after some experience with a new law and a determination of process costs and incremental benefits, union aggressiveness typically dropped off sharply.

Uncertainty in the arbitration process also can surround the criteria for arbitrators' decisions. Every statute in our study, except Pennsylvania's, contained an explicit list of criteria to guide arbitrators. In every case where arbitration had been used by the parties, though, both sides indicated a great deal of uncertainty in their initial resort to arbitration about what the arbitrator would use for the basis of his decision. Even if the criteria are clear, the weight attached to them is not specified. In every statute there is an open-ended approach to the criteria, as well. In Iowa, for instance, the section of the law outlining the criteria begins as follows: "The panel of arbitrators shall consider, in addition to any other relevant factors, the following factors. . . ."[16] In several jurisdictions, the parties reported that since the initiation of arbitration both sides had begun to agree on the "relevant" criteria (as a result of several arbitration decisions relying on those same criteria), so that the outcome was much more predictable now than it had been initially. Among the most important criteria is which cities or school districts are "comparable." Once this has been established, the determination of economic benefits and many other terms and conditions of employment becomes similar to the "prevailing rate" formula approach long familiar in the government contract area.

There is reason to expect that as criteria for decision-making by arbitrators become more certain, disputes subject to arbitration will be resolved short of the actual arbitration hearing.

Last-offer arbitration introduces constraints on the arbitrator which, on a first analysis, would appear to prevent the reduction of uncertainty. The arbitrator is prevented from taking a middle ground between the parties' final offers so that the variance of the expected outcome or incremental benefit is quite wide. But this first analysis does not take account of each party's strategy for reducing the risk of loss: both will attempt to reduce such risk by taking a more reasonable position than the opponent, hence moving toward some middle ground just as a conventional arbitrator might. The uncertainty premise, in fact, does not predict whether last-offer or conventional arbitration will be more successful in promoting voluntary settlement. The key element of uncertainty in both is what position the arbitrator is likely to view as most reasonable. In conventional arbitration, the arbitrator selects that as the outcome for the dispute. In last-offer arbitration, the arbitrator selects the position of the party closest to the most reasonable position. In either instance, the more precisely the parties can predict the arbitrator's judgment of reasonableness, the more likely they are to be able to settle their dispute voluntarily at that point. Where their estimates of arbitrator judgment are uncertain, the parties are most likely to resist concession for fear that it might be unnecessary.

Some empirical data are available from Iowa's experience with last-offer arbitration. There, as in every other State we studied, the parties are permitted to develop alternatives to the State-mandated procedure. In Iowa, the Public Employee Relations Act procedure provides for mediation, factfinding, and final-offer arbitration by issue, where one of the three final offers the arbitrator may select is the recommendation of the factfinder. The parties, where they have modified the process, have tended to drop the factfinding step. Board data reported in *IPERB*, a publication of the University of Iowa's Industrial Relations Institute, show ". . . that when arbitration was preceded by factfinding, the number of issues at impasse tended to be less than when arbitration immediately followed mediation."[17] Why? Because the parties are conditioned to know that arbitrators will tend to adopt the factfinders' recommendations. The incremental benefit uncertainty is reduced.

Data from Michigan show that the majority of all arbitration cases are resolved voluntarily, after an arbitrator is appointed but before the arbitrator issues an award. Our own experience as well as our discussions with Michigan arbitrators and the parties suggests that arbitrators, in the course of conducting a hearing, will nearly always caucus with the parties privately and give them clues, sometimes subtle and sometimes not so subtle, concerning what the arbitrators are likely to consider the "more reasonable" position. With such input, the parties "might as well settle." (Whether such settlements should be considered voluntary is another question.)

A hypothesis we are presently considering but have not yet tested relates to arbitrator turnover on the various State panels. In Michigan, a number of union and management representatives expressed the concern that there was no "new blood" among the arbitrator ranks. In fact, they were complaining that arbitrators working in Michigan had settled on the appropriate criteria for most issues in arbitration and that the complaining party was not satisfied with those criteria for at least some issues. The only way the complainer saw the possibility of winning on these issues was by the introduction of "new blood" with a new set of criteria or weights for the old criteria. In New York, there is considerable turnover among arbitrators because the New York Public Employee Relations Board ad hoc panel is limited to charging a comparatively low rate for its services. As soon as a person establishes himself or herself as a neutral, other, more lucrative opportunities become available. Under these circumstances, one would anticipate greater uncertainty toward neutrals and hence a greater resort to arbitration. A preliminary review of the data appears to mildly support the hypothesis. A higher proportion of agreements subject to arbitration are reached at that step than in most of the other States in our study.

Public reaction to strikes. Perhaps the best illustration of how uncertainty contributes to impasses involves the public reaction to strikes and the parties' inability to estimate it accurately. For example, management may perceive a public which is resistant to "excessive" union demands—a public which will reward, politically, a tough stance by management even to the point of taking a strike. The union, however, may perceive a much more sensitive public which will not tolerate an interruption of its public services. With such perceptions, continuation of the impasse to the point of a strike is likely. However, where both parties have accurate information on the public reaction to a strike—where uncertainty approaches zero—a strike is, *ceteris paribus*, less likely to occur. This appears to be true regardless of what that reaction is predicted to be—tolerant or intolerant. If tolerant, the union bargaining position is strengthened and the outcome will be higher settlement costs; if intolerant, the settlement will be lower. The point is that the parties do not have to go through the exercise (of striking or other impasse procedure) to eliminate the uncertainty. They have the answer before they begin.

Our examples illustrate several subtle but important points. First, uncertainty must be considered collectively across both parties. Simply because one party accurately assesses process costs and incremental benefits, a dispute will not necessarily be resolved short of the terminal step of an impasse procedure. As a consequence, an accurate assessment is not as critical as a shared assessment of the costs and benefits. Even if wrong, when both parties predict each other's as well as their own costs and benefits identically, a settlement is highly likely. Examples alone do not adequately treat these issues, but they should be considered in the development of a general model of impasse behavior.

WE HAVE DEALT completely on the point that uncertainty precipitates and contributes to the continuation of impasses. Perhaps we have overstated our case. Even in this brief discussion, the point was made that, theoretically, both parties could be left worse off than the opponent's "best real offer." If an arbitrator's (or judge's) skill is viewed by the parties as likely to lead to such an outcome, the uncertainty will perhaps induce a voluntary settlement. Sufficient anecdotal evidence exists to suggest that parties have been "frightened into a settlement."

Nonetheless, we believe that our analysis as well as the examples from our research support a conclusion that uncertainty contributes more to creating impasses than resolving them. To be more specific, uncertainty with respect to the future costs and benefits of continued disagreement decreases the likelihood of early settlement. This conclusion runs counter to the conventional wisdom which the authors shared before conducting the interviews. The response of the various participants forced us to reconsider the role of uncertainty and while a definite conclusion must await a more detailed review of our data, it appears that our hypothesis, if true, could and should play a role in the evolution of public-sector labor legislation. □

——FOOTNOTES——

[1] Our work was sponsored by the U.S. Department of Labor, Employment Standards Administration.

[2] Some State laws, such as in Massachusetts, enacted following World War II to deal with a rash of public and private sector strikes left a range of dispute resolution methods open to the State executive. This approach was based on the hypothesis that uncertainty as to eventual outcome would encourage the parties to voluntary settle their dispute. For a discussion of the merits of this approach as experienced in Massachusetts, see George P. Shultz, "The Massachusetts Choice-of-Procedures Approach to Emergency Disputes," *Industrial and Labor Relations Review*, April 1957, p. 361.

[3] This pattern is examined in other reports based on this project which are not yet published.

[4] If the net cost of continuing to disagree is negative (that is, there is a net benefit), the parties will continue to disagree. An impasse procedure should work to increase the costs or lower the benefits, or both, of continued disagreement so that the net cost of continuing to disagree becomes positive (that is, there is a net loss). Then the parties will agree.

[5] It is our conclusion that there are, *de facto*, two terminal impasse steps in public-sector bargaining in those States we have surveyed. Where arbitration is not available, the unions have demonstrated a willingness to strike regardless of statutory prohibitions. While it is not inconceivable, our research revealed no instance of a strike where a dispute was submitted to binding arbitration. This issue is addressed elsewhere in project reports.

[6] For example, a union seeking additional members might attempt to portray an image of militance and aggressiveness by forcing a strike. Or, a union might sell itself by saying that if it does not get its demands, it will go to arbitration. In our study, we found no examples of strikes designed to enhance the image of the union and only one clear case in which the union sold itself to the membership on the basis of a promise to arbitrate.

[7] Paul F. Gerhart and Richard Krolikowski, "Bargaining Costs and Outcomes in Municipal Labor Relations," *Journal of Collective Negotiations in the Public Sector*, forthcoming.

[8] We have found that an important part of the public sector bargaining process is the development of mechanisms to convey real offers. Experienced mediators, trusted by the parties, facilitate the development of such mechanisms.

[9] Some negotiators feel such a tactic represents a failure to bargain in good faith, and is therefore an unfair labor practice (which is illegal). Where the negotiator makes any offer contingent upon acceptance of the whole package, however, it clearly is not. Arbitration hearings tend to become quite heated, however, when one party attempts to introduce evidence concerning what the other had offered privately.

[10] In one instance, the parties indicated that for the first several times arbitration was used, they engaged in the "pull back." However, in each instance, it appeared useless because the arbitrator quickly cut through their respective facades and dealt with the key issues as though there had been no pull back. They also realized the potentially counterproductive nature of this tactic and reached a mutual understanding to submit only those issues not truly agreed upon to arbitration in the future. Both were more satisfied with the process. Such a development represents extraordinary maturity and, perhaps, special circumstances. It is not likely to be adopted universally.

[11] For example, consider a case where a union attaches great importance to binding grievance arbitration and less importance to a large wage increase, while management, just the opposite, attaches great importance to a low-wage settlement and less to arbitration. The best real offer of the union prior to arbitration was 6 percent in wages plus binding arbitration. Management's best real offer was 4 percent in wages plus binding arbitration. In the arbitration proceeding, however, both sides "pull back" from their best real offers for tactical reasons. The union, hoping to provide the arbitrator with something to "give to management" increases its wage demand to 10 percent while staying firm on the demand for arbitration. Management, using the same tactic, withdraws its offer of binding arbitration and drops its wage offer to 2 percent. The arbitrator, misjudging the priorities of the parties, awards a 10-percent wage increase without binding arbitration of grievances. The benefit to the union is negative because the additional 6 percent in wages over management's best real offer is not as valuable as a grievance arbitration. Management loses because the additional 4 percent in wages over the best real union offer is more costly than the value "saved" by avoiding grievance arbitration.

[12] The most extreme case of uncertainty with respect to judicial response is Ohio. In spite of the existence of the severe penalties of the Ferguson Act (or perhaps because of them), public employers did not invoke the act in any of the nine bargaining units we studied where strikes had occurred. These cases included sanitation, fire, police, and teacher strikes in medium to large cities (50,000 to 700,000 population). Due process under the act requires individual hearings, which (in larger cities, at least) add considerably to employers' process cost without any assurance that a judge will not subsequently dismiss the action on various technical grounds. The Ferguson Act has been invoked effectively, however, so that the threat (uncertainty) remains for unions and management, particularly in smaller jurisdictions where individual hearings could be conducted. The Ferguson Act, itself, merely requires individual notice, not a hearing. Civil service law requires hearing prior to dismissal of any certified employee.

[13] Public Employee Relations Act (1970), Section 1003.

[14] 600 *Government Employee Relations Report*, p. B16, Apr. 7, 1975.

[15] The phenomenon was observed in Pennsylvania, for example, where one police union attorney reported that virtually all police organizations he represented shortly after Act 111 was passed told him to take the case to arbitration. The process cost in Pennsylvania for the union is mitigated by the fact that the neutral's expenses and fees are borne entirely by the employer. Over time, however, the attorney noticed a distinct loss of aggressiveness among his clients. It became clearer (more certain) to them just what they could get from arbitration (the incremental benefit) and how much his attorney's fees (process costs) would be.

Customized 'final-offer': New Jersey's arbitration law

DAVID E. BLOOM

The New Jersey Fire and Police Arbitration Act took effect in November 1977, adding New Jersey's name to the growing list of States that currently utilize final-offer arbitration in the resolution of labor disputes in the public sector.[1] The final-offer procedures in New Jersey differ, however, from the procedures adopted in other States, and this report describes the uniqueness of the New Jersey mechanism and the philosophy in which it is grounded.

In 1968, the New Jersey Legislature passed the Employer-Employee Relations Act, granting New Jersey's public sector employees the right to organize and to ne-

---

David Bloom is a graduate student in the Department of Economics at Princeton University.

gotiate collectively the terms and conditions of their employment.[2] The act did not grant the right to strike, but it did establish the New Jersey Public Employment Relations Commission to help resolve bargaining impasses through mediation and factfinding. Unfortunately, neither mediation nor factfinding guaranteed finality in the resolution of labor disputes, and long drawn-out negotiations were quite common. In recognition of this situation, the New Jersey Legislature established the Public Employment Relations Study Commission in 1974 to make recommendations on alternative methods of dispute resolution. The implementation of final-offer arbitration in New Jersey is essentially an outgrowth of the commission's report.[3]

The report recommended that final-offer arbitration be the compulsory last step in the resolution of bargaining impasses in the public sector. This recommendation rested on three major premises: 1) because of the essential nature of public services, the interests and welfare of the public would be well-served by guaranteeing finality in the resolution of public-sector labor disputes;[4] 2) while guaranteeing finality in negotiations, final-offer would also foster the voluntary negotiation of a settlement because it tends to induce concessions by the parties; and 3) a final-offer mechanism could be designed which would allow the parties a wide scope for determining the conditions under which they could settle their dispute, so that the bargaining relationship would be undamaged. The first two arguments are standard and need not be discussed here. The third argument, which is somewhat novel, accounts for the variety of options available to the parties under New Jersey's arbitration law. In fact, this is precisely the feature of the New Jersey law which most differentiates it from the final-offer arbitration laws operating in other States.

Resolution mechanisms

Under the New Jersey law, the rules for implementing compulsory interest arbitration in labor disputes involving public safety employees are established by the Public Employment Relations Commission.[5] According to those rules, covered employees and employers must begin their contract negotiations at least 120 days before the employer's budget submission date.[6] If an impasse develops, the commission may assign mediators to aid in the resolution of the impasse at the request of either party or on its own initiative. In the event mediation fails, factfinders may be assigned at the request of either party to study the dispute and recommend a settlement. The costs of mediation are borne by the commission; the costs of factfinding are shared equally by the parties.

If negotiations are still at impasse 60 days before the employer's required budget submission date, then regardless of the use of mediation or factfinding, the parties must file a "60-Day Notification." This informs the commission of whether the parties have at least agreed upon a terminal procedure for settling the issues in dispute and, if so, it enables the commission to review and to approve or disapprove of the proposed procedure. In the event that the parties fail to agree on a terminal procedure within 50 days of the employer's budget submission date, they must each notify the commission of the unresolved issues.[7] Under these circumstances, the parties are compelled to have their dispute resolved by final-offer arbitration—with all economic issues as a single package and noneconomic issues on an issue-by-issue basis.[8]

There are basically five terminal procedures which the parties may request as an alternative to the compulsory procedure specified in the law. First, the parties may have conventional arbitration of all unsettled items. Second, the parties may require the arbitrator to choose between the final offers of the parties on all issues as a single package. Third, the parties may require the arbitrator to choose between the final offers of the parties on each issue separately. Finally, when there is a factfinder's report, the arbitrator may be requested to confine his or her choice to the parties' final offers and the factfinder's recommendations on either an issue-by-issue or a total package basis. The law explicitly does not limit terminal procedures to the five listed here, although it does require the parties to petition the commission for approval of any other variations.

Regarding the factors arbitrators consider in reaching their decisions, the law directs that arbitrators consider the overall compensation presently received by the employees, the comparability of wages, hours, and working conditions to those available in similar public and private employment, the cost of living, the lawful authority of the employer, the financial impact of the settlement on the governing unit and its residents and taxpayers, and the interests and welfare of the public. In addition, the New Jersey courts have held that arbitrators must also consider the constraints imposed by a 1977 State law, generally limiting annual increases in municipal budget expenditures to 5 percent.[9]

Arbitrators are appointed by the Director of Conciliation and Arbitration in recognition of the parties' preferences after the circulation among the parties of a list of seven members of the Public Employment Relations Commission's special panel of arbitrators. The costs of arbitration are borne entirely by the parties (subject to a fee schedule approved by the commission). Once the arbitrator is appointed, the parties are required to submit their final offers to the arbitrator in a form that is consistent with the terminal procedure in effect. At that point, the arbitration proceeding is completely under the control of the arbitrator. Existing wages and terms and conditions of employment cannot be changed by one party without the consent of the other during the pendency of an arbitration proceeding. Following the close of the arbitration hearings, arbitrators are expected to reach their decision and to convey it in writing to the parties as soon as possible. All changes called for in the arbitration award take place retroactive to the date of implementation prescribed in the award. Arbitrators cannot render an award involving pensions or benefits in the New Jersey State Health Benefits Program.[10]

From this discussion, it should be apparent that the basic orientation of the New Jersey arbitration law is toward encouraging the voluntary settlement of labor disputes at all stages of negotiation. Clearly, the variety of terminal procedures available to the parties is consistent with this view. In this same spirit, the law explicitly permits, and even seems to encourage, arbitrators to mediate disputes at all stages in the arbitration proceeding. The law also allows the parties substantial opportunity to modify or amend an award, even though awards are binding and enforceable. Finally, the law has even been interpreted to permit the parties to modify their final offers during an arbitration proceeding.[11]

Early experience

The law establishing compulsory interest arbitration in New Jersey took effect on November 1, 1977. Between that time and the end of the fiscal year on June 30, 1978, 259 public employers and public employee organizations filed requests for mediation, factfinding, or interest arbitration.[12] Of course, some units filed for more than one form of impasse resolution, but each is counted only once in this number. A breakdown of these cases according to whether mediators, factfinders, and arbitrators were actually appointed is given in table 1. The small number of mediator and factfinder appointments relative to arbitrator appointments stands out. It also stands out in statistics on cases initiated during the second fiscal year under the law.[13] As noted earlier, however, arbitrators are permitted to, and, as shown below, often do, mediate settlements so that the use of mediation may actually remain unaffected by the 1977 law.

Looking more closely at the breakdown of arbitrator appointments, table 2 presents the distribution of these appointments by employer type and by union type. The majority of public employers requesting arbitration are municipal governments. This is not surprising because about 95 percent of the public employers in New Jersey are municipal governments. Also, few of the unions involved in arbitration proceedings are firefighter unions. This is not surprising either because fire departments are local organizations operated by volunteers in approximately 85 percent of New Jersey's 567 municipalities.

As described in the previous section, one of the central features of the New Jersey arbitration statute is the wide scope it grants the parties to devise their own terminal procedures. However, during its first 8 months of operation, the parties relied on the law's example terminal procedure (final-offer on economic issues as a package and on noneconomic issues on an issue-by-issue basis) in 72 percent of the cases that were ultimately resolved by arbitration. Conventional arbitration was the next most frequently chosen alternative (16 percent), followed by issue-by-issue final-offer arbitration (5 percent), and one-package final-offer arbitration (1 percent); other commission-approved terminal procedures were used in 6 percent of the cases. Perhaps more experimentation with alternative terminal procedures can be expected as the parties gain experience under the new law, although, on the basis of awards rendered in cases initiated during the second fiscal year under the law, such a pattern has not yet emerged.

It was implied in the description of the law that there are a variety of stages at which a labor dispute involving public safety employees can end. Ordered from the least to the most extensive form of third-party intervention, these stages of settlement are as follows: 1) in direct negotiations with no appointments at all; 2) with the appointment of a mediator; 3) with the issuance of a factfinder's report with recommendations for settlement; 4) with the appointment of an arbitrator but before arbitration hearings have begun; 5) with the appointment of an arbitrator who mediates the dispute during the arbitration proceedings and who may issue a 'consent award' consisting of the terms of the dispute on which the parties have voluntarily settled; and 6) with the appointment of an arbitrator who issues a binding and enforceable award under conventional arbitration, final-offer, or any other terminal procedure devised by the parties and approved by the commission. Table 3 provides a breakdown of cases according to these six stages. Arbitration awards were clearly the most prevalent method for resolving disputes, with 79 of the 95 awards being final-offer in nature (the rest were conventional arbitration awards). At the other end of the spectrum, factfinding, which has rarely been used, led to no settlements; in fact, the commission received no requests for factfinding in cases involving public safety employees during the fiscal year ending June 30, 1979. It is also interesting to observe that arbitrators acted as mediators in a large proportion of cases. Combined with other mediated settlements, the use of mediation by a third party was nearly as important as the issuance of final-offer awards in the settlement of disputes. Thus, it is possible to regard mediation and arbitration as a joint mechanism for resolving labor disputes under the New Jersey law, rather than simply as disjoint procedures.[14] □

FOOTNOTES

[1] Other States which also utilize some form of final-offer arbitration to resolve labor disputes involving public safety employees are Wisconsin (1972), Michigan (1972), Massachusetts (1973), Iowa (1974), and Connecticut (1979). In Wisconsin and Massachusetts, the arbitrator is limited to choose among the parties' final offers on all issues as a single package. In Michigan, Iowa, and Connecticut, the arbitrator may choose among the parties' final offers on an issue-by-issue basis. The Michigan procedure is limited, however, to the resolution of economic issues.

[2] The New Jersey Fire and Police Arbitration Act, approved May 10, 1977 (P.L. 1977, Chapter 85, 1977 Senate No. 482), amendment to the New Jersey Employer-Employee Relations Act, approved April 30, 1941 (P.L. 1941, Chapter 100; Chapter 34: 13A–1 et. seq.).

[3] Report to the Governor and the Legislature by the Public Employer-Employee Relations Study Commission pursuant to P.L. 1974, c. 124, State of New Jersey, February 2, 1976.

[4] Conventional arbitration schemes also guarantee finality, but it has been argued that they do so in a way which reduces the likelihood of a voluntary settlement. This is the so-called 'chilling effect' of conventional arbitration. (However, see Craig A. Olsen, "Does 'final offer' allow the bargaining that conventional arbitration chills?" *Monthly Labor Review*, May 1979, pp. 38–39.) Another criticism of conventional arbitration mechanisms is that when these mechanisms are operative, the parties tend to rely on the judgment of arbitrators regarding acceptable agreements and therefore do not bargain as seriously as they otherwise would. This is referred to as the 'narcotic effect' of conventional arbitration.

[5] Although the Study Commission's Report to the Governor recommended that final-offer arbitration procedures apply to all public sector employees, this was not acceptable to teachers, school boards, and several other major groups in New Jersey. Consequently, the law was written so that it applied only to public safety employees.

[6] The law is broadly construed to cover employees in all firefighting, police, and other corrections units on the municipal, county, and State levels of government. The required budget submission date refers to the first budget which implements the new labor agreement.

[7] It is worthwhile to note that, according to the rules, the failure of any party to file any notification, petition, or other statement will not preclude the implementation of compulsory interest arbitration.

[8] In the event the parties disagree over the classification of an item as economic or noneconomic or over the negotiability of an issue as required, permissive, or illegal, the parties must petition the Public Employment Relations Commission, which makes the final determination.

[9] The Cap Law was enacted by the New Jersey Legislature in 1977. This law places a 5-percent ceiling on increases in municipal budget expenditures, although municipalities may file for specific exemptions. Undoubtedly, this law has restricted the bargaining range in public sector negotiations. At the very least, it would certainly seem to account for the prevalence of public employers to choose 5-percent increases for their final salary offers. The existence of this law has also heightened the controversy surrounding the use of final-offer arbitration in New Jersey because arbitrated awards are, by definition, binding on the public employer and are not limited to 5-percent increases.

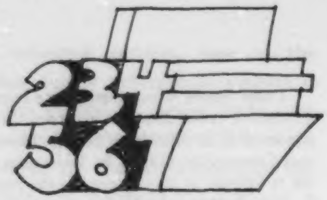
The Anatomy of Price Change



Slowdown in energy prices eases second-quarter inflation

WILLIAM THOMAS, ANDREW CLEM, AND EDDIE LAMB

After a sudden acceleration in the opening months of 1980, the pace of inflation slowed somewhat during the second quarter. From March to June, the Consumer Price Index for All Urban Consumers (CPI-U) moved up at a seasonally adjusted annual rate of 11.6 percent, following an 18.1-percent rate in the previous 3 months and a 13.3-percent increase from December 1978 to December 1979. Most of the slowdown was due to energy prices, which dropped from a 64.8-percent rate of increase in the first quarter to a rate of 8.1 percent in the second. Retail price advances for commodities other than food and energy also decelerated, but much more modestly. In contrast, charges for consumer services other than energy rose sharply for the second consecutive quarter. Food prices continued to rise moderately. (See table 1.)

The slowdown in the CPI would have been more pronounced except for the continued sharp increase in the home financing component, which reflected steep increases in interest rates during the opening months of the year. Excluding mortgage interest costs, the rate of advance in the CPI decelerated from 14.8 percent in the first quarter to 7.5 percent in the second.

The easing of inflation in the second quarter was considerably greater at the primary market level. The Producer Price Index (PPI) for Finished Goods rose at a seasonally adjusted annual rate of 6.3 percent, only one-third of the 18.9-percent rate registered in the preceding 3 months and half as fast as the 12.6-percent climb in 1979. As in the CPI, the most dramatic slowdown occurred for energy goods, which had skyrocketed at a rate of more than 100 percent in the first quarter before slowing to a rate of 17.1 percent in the second. Price rises for consumer goods other than foods and energy also decelerated markedly. Further signals of an inflation slowdown were evident in prices for intermediate and crude materials.

The relative slowdown of inflation during the second

[1] See "Definitions" and "Notes" preceding tables 22–30 Current Labor Statistics in this *Review*.

[2] Not seasonally adjusted.

NOTE: Monthly data for Producer Price Indexes have been revised through February 1980 to reflect the availability of late reports and corrections by respondents. For this reason, some of the figures shown above and elsewhere in this report differ from those previously published.

William Thomas, Andrew Clem, and Eddie Lamb are economists in the Office of Prices and Living Conditions, Bureau of Labor Statistics. They were assisted by Craig Howell and Mary Burns, economists in the same office.

quarter reflected, among other things, the completion of most of the direct and indirect pass-through of the latest round of steep crude oil price boosts and of the impact of the recession. The National Bureau of Economic Research designated January 1980 as the beginning of the business cycle downturn. The recession first affected the residential construction and automobile markets and then spread through much of the rest of the economy. The collapse of a speculative boom in prices of a broad variety of basic materials, particularly precious metals and other nonferrous metals, also contributed to the general easing of inflation.

Energy

The rate of increase for energy prices slowed in the second quarter. (See table 2.) Substantially weakened demand worldwide for petroleum resulted in inventories that were more abundant than at any time since 1978. The crude petroleum market calmed in the early months of 1980, and prices set by the Organization of Petroleum Exporting Countries temporarily stabilized.

In late 1979, panic buying of crude oil again broke out among the oil-consuming nations, partly as a result of fears concerning the security of oil supplies during the crises in Iran and Afghanistan. This enabled some OPEC members to put through another round of price hikes. Saudi Arabia raised its benchmark oil price in December and again in January in an effort to achieve a unified price structure for OPEC. However, this action only led to further increases by other OPEC members.

Between February and May, on the other hand, contract prices for OPEC crude oil changed very little as a consequence of slack demand associated with a recessionary trend in many Western Nations. During this time, the volume of spot market transactions fell, and spot prices for crude oil dropped from an average of about $40 per barrel in December to $32 in June. At the end of the second quarter official OPEC contract prices ranged between $28 for Saudi light crude to $37 for top quality African crudes.

Stocks of crude petroleum in the United States were increased to record levels during the second quarter, reflecting the reduction in both output and consumption of refined products. Primary stocks[1] of refined petroleum products were substantially above those of a year ago, as demand fell in response to the sharp price increases registered during 1979 and early 1980, and declining economic activity. Lower demand and slower rises in crude oil prices led to more moderate price increases by petroleum refiners.

In the second quarter, price increases slowed dramatically for most energy items sold to consumers. Retail energy prices rose at an 8.1-percent rate, after climbing at a 64.8-percent rate in the first quarter and advancing 37.4 percent during 1979. Producer prices for finished energy goods also slowed, from a 109.2-percent annual rate of increase during the first quarter to a 17.1-percent rate in the second; these prices had advanced more than

60 percent in 1979. Retail gasoline prices turned down slightly for the first time in two years, responding to sagging demand. These prices had risen 68.1 percent during the year ended March 1980, as consumption declined about 8 percent.[2] In contrast to the retail price drop, prices received by gasoline refiners continued to rise, although at a much slower pace than in the previous year and a half. Prices for home heating oil continued to rise in the second quarter at both the retail and producer levels, but at a substantially slower rate than in the first quarter. Primary stocks of middle distillates (fuel oil and diesel fuel) were more than 50 percent above the level of a year earlier, when these products were in short supply. At the urging of the Carter Administration, oil companies had increased their stocks of fuel oil during the summer and fall of 1979. However, because the winter weather was milder than in recent years in most parts of the country, demand was lighter than expected.

In contrast to moderating petroleum prices, retail prices for piped gas rose considerably more than in the first quarter, as higher prices for imported and domestic natural gas were passed on to the consumer. Most of the increase in the CPI for piped gas was accounted for by cities in the Western region. Household electricity rates also increased more than in the first quarter because of earlier price increases for power-generating fuels.

Producer prices for intermediate energy goods (those sold to business establishments) increased at a 6.4-percent annual rate, far less than the 62.2-percent rate of the previous quarter. Residual fuel prices fell sharply, after advancing 62.8 percent during 1979, and continuing this upward trend in the first quarter of 1980. The decrease was due to plentiful supplies and the substitution of other fuels by some industrial users. Demand was further weakened by the recession-induced drop in production levels in certain industries. The rate of increase in prices for diesel fuel and commercial jet fuel slowed considerably.

Liquefied petroleum gas prices were virtually unchanged following very rapid advances during 1979 and early 1980; demand for butane by gasoline refiners and for propane and ethane by petrochemical producers had been strong but weakened when the recession began. Electric power rates for industrial and commercial consumers rose at a 15.7-percent rate in the second quarter, somewhat faster than during 1979, but not as fast as in the first quarter. Fuel cost adjustments accounted for part of the increase, and some utilities incurred extra investment costs by switching from petroleum fuels to coal, natural gas, or nuclear power.

Prices for crude energy materials increased much less than in any of the preceding four quarters. The crude petroleum index (which only includes domestic production) slowed to a 21.6-percent rate, following a 61.3-percent advance in the 12 months ended in March. The deceleration was partly due to the fact that prices for the 24-percent share of U.S. crude oil production which was not controlled changed very little during the spring, reflecting the flat prices on the world market. Natural gas prices continued to rise rapidly, primarily because of sharp advances in prices for natural gas imported from Canada.

Finished goods except foods and energy

Consumer goods. In the CPI, prices for commodities except food and energy advanced at a seasonally adjusted annual rate of 7.3 percent, less than the rate posted in the first quarter and somewhat below the 8.8-percent rise for 1979. (See table 3.) At the producer level, the slowdown was more pronounced. The PPI for finished consumer goods less foods and energy rose at an 8.3-percent rate after rising at a 17.4-percent rate in the first quarter and 9.6 percent in 1979. The slowdown resulted partly from a decline in economic activity which began in January.

Home purchase prices increased at a 14.9-percent annual rate from March to June, much faster than in the first quarter but not as fast as in 1979. (The CPI for home purchase is derived from Federal Housing Administration data.) When home purchases are excluded, the CPI for commodities except food and energy increased at an annual rate of 4.5-percent, compared with an 11.1-percent rate in the first quarter, and a rise of 6.0 percent in 1979.

Jewelry prices moved up at a much slower pace at both the retail and manufacturing levels. Prices for precious metals, which had soared at the beginning of the year, declined significantly and then rebounded somewhat in June.

Used car prices fell for the second consecutive quarter, as dealers lowered prices on the larger, less fuel efficient models in the face of rapidly rising gasoline prices. Price increases for new cars continued to rise, in spite of a major sales slump; rebates for some models were more than offset by price advances resulting from earlier cost increases, particularly among metals. In addition, price increases for imports reflected strong consumer demand for smaller models. Prices for tires rose much less than in the first quarter, a result of the reduced demand for autos.

Among the capital goods increasing steeply early in the quarter but more slowly afterwards were motor trucks, construction machinery, machine tools, plastic and rubber industry machinery, oilfield machinery, and aircraft. Demand for most kinds of capital goods other than motor vehicles remained strong during the second quarter, and most producers were able to continue to pass through higher costs for metals and other inputs.

However, after advancing at a rate of nearly 15 percent in the preceding quarter, commercial furniture prices rose only one-third as rapidly from March to June.

Services less energy

The CPI for services other than energy rose at a 20-percent annual rate, nearly as much as in the first quarter, and considerably more than the 13.6-percent advance in 1979. (See table 4.) Much of the second quarter increase occurred because of sharp advances in the contracted mortgage interest cost index, which reflected interest rate hikes that occurred earlier in the year. Transportation service charges continued to move up rapidly, but charges for most other services rose considerably less than in the previous quarter.

The index for mortgage interest rates advanced at an annual rate of about 40 percent for the second consecutive quarter, after rising 16.1 percent in 1979. The sharp boost during the spring reflected the credit-tightening actions by the Federal Reserve Board in the previous quarter. Conventional mortgage interest rates are represented in the CPI by actual contract mortgage loan transactions and not by current commitment rates for future mortgages. Property insurance premiums, which reflect both insurance rate changes and changes in the insured values of constant quality housing, rose at a 16.7-percent rate, about as much as in the first quarter, but faster than during 1979. On the other hand, property taxes turned down. Charges for home maintenance and repair moved up at a much slower rate than in any of the previous 4 quarters.

Prices for transportation services rose at a higher rate than in the preceding quarter. Because of jet fuel costs, airline fares continued to increase sharply, although not as much as during the second half of 1979. The large advances for intercity train fares and taxi fares also were due to fuel costs. Automobile finance charge increases reflected earlier rises in market interest rates.

The rate of increase slowed for the other service categories. Medical care services rose at a rate much less than in the 3 preceding quarters; this slowdown was evident in both professional and hospital related services. Similarly, the indexes for entertainment and personal care services registered much smaller advances than in the first quarter.

Foods and related products

Consumer prices for foods rose at a 5.6-percent annual rate from March to June, more than the 3.8-percent rate in the first quarter, but considerably less than the 12.1-percent annual rate in the fourth quarter of 1979. Retail food increases in the second quarter were greatly influenced by advances in distribution costs, which resulted in large part from earlier rises in energy prices.

Table 3. Changes in retail and producer prices for consumer goods other than food and energy, 1979–80

Commodity	Index	Relative importance December 1979	Compound annual rate, seasonally adjusted except as noted, for 3 months ended—

[6] "Tires and tubes" in the PPI.

[7] "Jewelry and luggage" in the CPI; not seasonally adjusted in the CPI or the PPI.

[8] Not included in the PPI.

At the primary market level, processor prices for foods fell even more sharply (7.8-percent annual rate) than in the first quarter (1.2-percent annual rate). In both the CPI and PPI, prices for meats fell sharply, while prices for sugar and sweets continued to soar. (See table 5.)

Prices for beef and veal, pork, and poultry declined substantially at both the retail and processor levels reflecting abundant supplies for pork, increased poultry production, and competitive price reductions for beef and veal. At the farm level, prices for cattle, hogs, and live poultry fell at an annual rate of more than 30 percent, the second consecutive quarterly decline. Heavy hog slaughter resulted in lower prices for both hogs and cattle. Live poultry prices fell primarily in response to more than ample broiler and fryer supplies.

Abundant supplies of soybeans caused prices to decline in world markets. As a result, the index for fats and oils moved down, led by lower prices for margarine and shortening. The index for grains declined for the second consecutive quarter, mostly as a result of lower prices for wheat. Favorable growing conditions in areas producing winter wheat raised expectations for an excellent harvest. On the other hand, corn prices averaged higher over the quarter, as extremely dry weather in growing areas resulted in concern about a smaller harvest due to planting delays and inadequate moisture.

Retail prices for sugar and sweets rose at an annual rate of more than 40 percent for the second consecutive quarter, after rising 7.4 percent in 1979. Producer prices for refined sugar for consumers soared nearly as much as in the first quarter; in June, prices were double the year-ago level. Raw sugar prices rose from 18 to 29 cents per pound from December to June. The pattern of price movement in the first and second quarters was similar; unusually sharp increases in February and May were followed by downward adjustments, as speculative purchases contributed to price instability.

Table 4. Changes in consumer service prices, 1979–80

Item	Relative importance December 1979	Compound annual rate, seasonally adjusted except as noted, for 3 months ended —

[2] Not seasonally adjusted.

Intermediate materials less foods and energy

The index for intermediate materials less foods and energy slowed to a 5.1-percent annual rate in the second quarter, after accelerating to a 17.2-percent rate from December to March. The first quarter advance was the largest since the third quarter of 1974, while the second quarter rise was the smallest since the final quarter of 1977. This dramatic slowdown was principally the result of the sharp drop in precious metals prices, as well as the steep decline in business activity in early spring. In response to low sales levels and high interest costs, manufacturers tried to reduce their stocks of materials and supplies in the second quarter; this led to weaker demand for many items whose prices had risen sharply earlier in the year.

One factor which tended to magnify inflation in the first quarter was widespread commodity speculation, particularly among precious metals. Extremely sharp increases in January brought gold prices to a level more than triple that of January 1979, while silver prices were more than seven times what they were a year prior to then. Partly because of tightened credit markets, gold prices fell about 30 percent over the next 3 months, and prices for silver plummeted about 70 percent through May. Gold and silver prices then rebounded somewhat in June. If the categories for precious metals and photographic film (which contains substantial proportions of silver) were removed from the index for intermediate materials less foods and energy, the first and second quarter annual rates of increase would have been 13.8 percent and 7.2 percent.

The sharp declines in precious metals prices contributed to the downturn in the durable manufacturing materials category, which fell at a 4.4-percent annual rate, after increasing at a 16.1-percent rate in the first quarter and moving up 16.8 percent in 1979. In addition, prices were lower for several other primary nonferrous metals. Copper prices fell because of weakened industrial, construction, and speculative demand and lead prices continued to drop, as production of automobile batteries remained at low levels. In contrast, the index for primary aluminum rose sharply despite weaker domestic demand. The increase reflected higher energy costs, which have a larger impact on aluminum prices than on prices of other metals. Prices for finished steel mill products were raised an average of 3 percent in April, with the largest increases for flat rolled sheet and strip. The increase was attributed to higher labor and energy costs, but there was some discounting by the end of June, in response to slack demand from the automotive industry and others.

Table 5. Changes in retail and producer prices for consumer foods, 1979–80

	PPI	1.9	6.8	14.3	9.8	1.9	−8.4

[1] Includes items not listed. The CPI includes prices of food away from home, which account for about 31 percent of the food index. The PPI for finished consumer foods does not reflect restaurant prices.

[2] Not seasonally adjusted in the CPI.

[3] "Sugar and confectionery" in the PPI.

[4] Not seasonally adjusted in the PPI.

[5] "Vegetable oil end products" in the PPI.

Hardwood lumber prices declined even more than in the first quarter, reflecting weakened demand for household furniture. The indexes for plastic components and laminated plastic film registered very little change after advancing sharply in the previous quarter. The recession restricted the ability of plastic producers to continue passing through petrochemical feedstock price hikes.

The construction materials index slowed to a 3.8-percent annual rate of increase, the smallest quarterly advance in more than 3 years. The annual rate of private housing starts was about 1 million units in the second quarter, less than half the average rate during 1978. Softwood lumber prices fell sharply for the third consecutive quarter, and millwork prices turned down after rising in the first quarter. However, plywood prices turned up sharply in May and June as producers cut their output levels in response to the 13.2-percent decline in prices in the 12 months ending in April. The slowdown in housing construction also led to sharp declines in prices for copper wire and cable, gypsum products, and clay tile. In addition, price increases slowed for several other items such as heating equipment and brass fittings.

The nondurable manufacturing materials index rose at a 13.4-percent annual rate, somewhat less than in any of the five previous quarters. The surge in crude oil prices in early 1980 led to substantial increases in April in the indexes for industrial chemicals, plastic resins and materials, and synthetic rubber. However, decreased demand resulted in moderating prices by June. Among textile products, synthetic fibers prices continued to move up about as much as in the first quarter, mainly because of higher petrochemical feedstock costs. Price increases slowed, however, for processed yarns and threads and finished fabrics, as apparel manufacturers reduced their orders in response to the recession.

Woodpulp prices rose sharply in April, largely because the decreased output of lumber curtailed supplies of wood chips. Higher woodpulp prices, in turn, contributed to accelerating price increases for paper and paperboard. Prices continued to decline for leather and inedible fats and oils, as world supplies exceeded demand.

The manufacturing components index moved up only half as much as in the previous quarter. Weakened industrial demand was the primary factor behind the slowing rates in the indexes for electronic components and accessories, internal combustion engines, motor vehicle parts, electric motors, and switchgear and switchboards.

Price moderation was also evident in other intermediate products. Wooden pallet prices turned down at the beginning of 1980 and continued to decrease through June because of weaker demand, which reflected the lower levels of manufacturers' shipments. Photographic supply prices fell after climbing steeply in February, in response to similar fluctuations in prices for silver, which is heavily used in making camera film. Price increases for mixed fertilizers slowed significantly, following rapid advances during the first quarter of 1980 and much of of 1979. Fertilizer demand was slow because of poor prospects for crop earnings and high interest costs.

Crude nonfood materials less energy

The index for crude nonfood materials less energy turned down sharply at a 37.5-percent annual rate following an increase at a 6.6-percent rate in the first quarter of 1980. From December 1978 to December 1979, this index rose 13.1 percent. Prices for ferrous scrap fell at an even sharper rate in the second quarter (64.1 percent) than in the first (21.2 percent). Domestic production of steel was far below the levels experienced in 1979; foreign demand for ferrous scrap was also low. Prices for aluminum base scrap declined at a 90.4-percent annual rate after skyrocketing in the previous 2 quarters. The index for copper base scrap registered declines over both the first and second quarters; prices fell sharply in March and April in response to a weakening world market.

Prices for hides and skins and cotton declined as a result of weak export and domestic demand. Prices for wastepaper declined because of poor demand from paperboard mills and the building materials industry. Natural rubber prices turned down as speculators liquidated holdings because of reduced demand from tire manufacturers and other industrial users. In contrast, higher prices were registered for iron ore, in response to increased labor costs, and for sand and gravel, because of higher energy costs.

———*FOOTNOTES*———

[1] "Primary stocks" refer to petroleum products stored at the refinery or at bulk terminals, and exclude inventories of retailers, jobbers, etc.

[2] American Petroleum Institute figures show a decrease in gasoline deliveries from primary storage of about 8 percent from April 1979 to April 1980.

Cost-of-living indexes for Americans living abroad

The U.S. Department of State has prepared new indexes of living costs abroad for Americans in Canberra, Ottawa, Madrid, and Caracas. The new indexes are 3 percent higher for Madrid, 1 percent higher for Ottawa, and about 2 percent lower for Canberra and Caracas than previous indexes. (See table 1.) The periods between survey dates were 8 months for Canberra and about 1 year for the other cities.

The new indexes reflect changes in the exchange rates used to calculate the indexes, as well as changes in the prices of goods and services (excluding housing and children's education) between survey dates. Also, the new indexes were computed by the Bureau of Labor Statistics, using new expenditure weights derived from 1972–73 Consumer Expenditure Survey data for Washington, D.C. The new weights are being used to compute all indexes based on retail price surveys conducted after July 1979.

The higher index of living costs for Americans in Madrid reflects the depreciation of the U.S. dollar relative to the peseta, and the lower index for Canberra reflects a small improvement in the exchange rate value of the U.S. dollar versus the Australian dollar. For Americans in Ottawa and Caracas, the exchange rates were essentially unchanged, but the new surveys showed average prices paid in national currency were up by 2 percent in Ottawa, but were 2 percent less in Caracas, compared with prices in Washington, D.C.

Because exchange rates are subject to sudden shifts, it is advisable to check the prevailing rates whenever using the indexes of living costs abroad.

The indexes for all 162 reporting cities are published in quarterly reports entitled *U.S. Department of State Indexes of Living Costs Abroad and Quarters Allowances.* The entire list is published in April of each year. The reports are available upon on request from the Office of Publications, Bureau of Labor Statistics.

The methods of compilation and use of the indexes are described in *U.S. Department of State Indexes of Living Costs Abroad and Quarters Allowances: A Technical Description* (BLS Report 568, April 1980), also available from the Office of Publications, Bureau of Labor Statistics. □

Conventions

Auto Workers seek Government aid for laid-off workers, ailing industry

LARRY T. ADAMS

Amid the most severe downturn in automobile production since 1963, the United Automobile, Aerospace and Agricultural Implement Workers of America (UAW-Ind.) held its 26th constitutional convention in Anaheim, Calif. In his keynote speech, President Douglas Fraser reminded the 3,000 delegates that 235,000 auto workers were on layoff, foreign auto and truck imports were taking an ever increasing share of a shrinking U.S. domestic market and, summing up the outlook for the industry, that "if you see a light at the end of the tunnel, it is probably an oncoming freight train."

The triennial convention was held June 1–6 during a sharp slump in automobile demand. For the most part the problems in the industry are due to the recession and high interest rates and the related encroachment of imports into the U.S. domestic market. With the high cost of gasoline, as well as concern about its continued availability, demand for autos has shifted from large and mid-size cars to more efficient compact and subcompact models. Foreign carmakers have captured a growing share of the market; imports rose from 18 percent of auto sales in 1978 to 28 percent in early 1980. A similar trend has occurred in the U.S. truck market with foreign models accounting for 9 percent of sales in 1978, 15 percent in 1979 and 23 percent in early 1980.[1]

As the U.S. car and truck makers close plants, some permanently and others for retooling to manufacture smaller, more efficient vehicles, record numbers of autoworkers have been placed on temporary or permanent layoff. Nearly 325,000 are now on layoff, with more furloughs anticipated in the future, in contrast to the downturn experienced during 1973–75 when 213,000 UAW members were out of work.[2]

Government help sought

Historically, the UAW has pursued the goals of economic security for its members through creative collective bargaining strategies. However, faced with a deepening nationwide recession and severe competition from imports, the union is now turning to the government for measures which will secure the long-term survival of the industry.

Trade barriers. In a dramatic break with the UAW's free trade position, the delegates were told that the union has begun legal steps to secure temporary import protection until U.S. automakers increase small car capacity to obtain a competitive marketing position.

Claiming that "Japanese auto manufacturers—especially Toyota and Nissan—are unfairly exploiting the U.S. companies' past neglect of small car production," the UAW has filed for import relief under the Trade Act of 1974.[3] As domestic automakers move toward a mix of vehicles consistent with current market demand, the Auto Workers seek temporary trade barriers to protect the shrinking U.S. share of the domestic auto market. Confronted with forecasts that 60 percent of auto sales by 1985 will be foreign made vehicles, Fraser noted that "as penetration increases you're going to find it more difficult to turn back that penetration and get your market back. And there is a very simple reason for that. When the American consumer goes into the market and buys a big ticket item, like an automobile, and that automobile is well designed, a quality product on which they get good service and durability—when they go back in the market three or four or five years after that first purchase, they're apt to buy the same product."

The petition requests relief from import competition by all countries, except Canada, for 5 years (to be phased down after 3 years). The UAW asked the International Trade Commission to recommend to the President (1) that the duty on new passenger vehicles be increased from 2.9 percent to 20 percent; (2) that quotas be imposed on imports based on 1975 or 1976 import levels; and (3) that imports assembled principally from U.S. or Canadian labor, components, or material be excluded from the tariffs and quotas.

Assistance to workers on layoff. The delegates adopted a number of resolutions aimed at maximizing the economic assistance available to workers on layoff. The mainstay of the Auto Workers economic aid package is the Supplemental Unemployment Benefits Plan (SUB), pio-

---

Larry T. Adams is an economist in the Division of Industrial Relations, Bureau of Labor Statistics.

neered by the UAW in 1955. Under this program, participating employers contribute a specified amount per hour worked to the SUB fund. The benefits disbursed from the fund, when added to the unemployment compensation or other transfer payment due the worker, provide compensation equal to a specified percent of the employees' pre-layoff earnings. However, during prolonged periods of high unemployment in the auto industry funds have been depleted, with workers furloughed late in the layoff period receiving little or no compensation from the fund. Any increase in transfer payments (unemployment insurance benefits, Federal-State extended unemployment benefits and Trade Readjustment Assistance benefits) to affected workers increases the fund's ability to assist a greater number of workers over a longer period of time.

Unemployment insurance. The delegates called for the enactment of a single Federal unemployment insurance program to supplant State laws currently in force. The proposal commits the UAW to seek an unemployment insurance program that would insure payment equal to at least two-thirds of the employee's average weekly earnings; provide medical and hospital benefits for the duration of the eligibility period; protect pension and social security credits; and increase the basic eligibility period to 52 weeks.

To provide additional economic assistance to laid-off workers and protect the solvency of the SUB funds, the UAW and the AFL-CIO joined in filing suit against the U.S. Department of Labor on the issue of extended unemployment insurance payments authorized under the Federal-State Extended Unemployment Compensation Act 1970. This legislation provides an additional period of unemployment insurance eligibility when the national rate of insured unemployment reaches 4.5 percent for a period of 13 weeks. At issue in the suit is the method of calculating the 4.5-percent trigger rate. During previous economic downturns, the trigger percentage was calculated using both the number of currently eligible unemployment insurance recipients as well as those having exhausted their benefits. Under regulations now issued by the Department of Labor, only the currently insured unemployed are used to calculate the trigger, thereby forestalling or precluding extended Federal-State unemployment benefits during the current recession.

Trade Act coverage. Extensive use has been made of the benefits provided workers under the Trade Act of 1974. The Act provides that workers laid off substantially as a result of imports are eligible for a Trade Readjustment Assistance allowance of up to 70 percent of their average weekly earnings for up to 52 weeks (with the SUB fund augmenting that amount up to a fixed percentage). Between April of 1975 and September of 1979, $168 million in assistance was paid to 94,300 UAW members. Since October 1, of last year, $150 million has been paid to 50,000 workers on layoff from Chrysler and 200,000 more auto industry workers have been certified as eligible to receive benefits.

The delegates lauded the Trade Readjustment Assistance as a great help in adjusting to the economic dislocations currently rocking the industry, but many felt that the act unfairly discriminates against many thousands of employees on layoff from independent parts suppliers. Parts employees are deemed eligible for assistance only if the manufactured part is imported as a separate item, not as a part of an assembled vehicle. Under the present act, few, if any, of the parts workers will receive benefits during the current downturn. A resolution was passed to seek benefits for these workers.

Plant closings. While there was much concern about the thousands of workers on temporary layoff, the most fervently debated resolution dealt with a cause of permanent job loss—plant closings. Although conceding the inevitability of economic change in a free economy, the resolution, detailing the personal and social costs of economic dislocations, called for the passage of the National Employment Priorities Act now before Congress.

The pending legislation would require advance notice of plant closings and investigatory hearings by the Department of Labor to determine the economic necessity for the closing, the anticipated economic and social loss to the employees and the local government, and alternatives to mitigate the adverse impact of the plant closing.

In addition to providing financial assistance to the employer to aid in averting a plant closing, the proposed act would provide an affected employee with transfer rights, relocation expenses, income and fringe benefit protection, job search assistance and special protections for older workers. To aid the affected local communities, the act stipulates payment by the corporation to the local government to compensate for the loss of tax revenue and a similar payment to the Federal Government if the plant closing involves moving operations out of the United States.

Changes in leadership

Four officers who worked with Walter Reuther in shaping the UAW announced their retirement: Emil Mazey, Pat Greathouse, Irving Bluestone, and Ken Bannon. The turnover of leadership will be complete with Fraser's retirement in 1983, but the liberal and innovative outlook of the union is not expected to change.

President Fraser, three incumbent vice presidents and the four new international officers ran unopposed and were elected by acclamation. Ray Majerus was elected to the office of secretary-treasurer. Owen Beiber, Don

Ephlin, and Stephan Yokich were elected to replace the three retiring vice-presidents.

In announcing the responsibilities of the four new officers, Fraser cautioned against using the distribution of duties for speculation on his successor. Ray Majerus will handle negotiations with the American Motors Corp. and the union's aerospace employers; Yokich will direct the agricultural implement department, a function performed primarily by Greathouse before his retirement. Don Ephlin will succeed Ken Bannon as director of the Ford Motor Corp. department; and Owen Bieber will assume responsibility for the General Motors Corp. department.

Other issues

Constitutional changes. In action to amend the constitution, the delegates raised the salaries of the international officers and changed the dues levy on members receiving SUB payments from a fixed $5 per month to one hours' pay (before layoff) per month. The convention also ratified an amendment diverting one-half of the interest earned on strike-fund investments to a special account, under the control of the International Executive Board, for organizing, education, and communication.

Presidential endorsement. Fraser stressed the need for the UAW to play an active part in the upcoming national elections. He further stated, however, that "the politics of our nation are in disarray" and that "the international executive board and the [delegates] . . . are never of one mind" on the matter of a presidential endorsement. Therefore, the union will poll the delegates at a later date to determine the will of the membership prior to making an endorsement.

Codetermination. While Fraser has drawn criticism from management, academicians and other union leaders for his election to the board of directors of the Chrysler Corp., similar feelings were not common among the delegates. Fraser won a seat on Chrysler's board as a concession for the union's role in aiding the ailing auto maker. He acknowledges that his dual role might pose a conflict but considers it necessary for a voice to be heard within the boardroom before irrevocable decisions are made. He declared to the delegates and the shareholders of Chrysler that the principle which will guide him in the role of board member "is that the workers of this country, whether it [sic] be [at] Chrysler or Ford or anyplace else are entitled to a voice in their own destiny and their own future." ☐

Special Labor Force Reports–Summaries

School and work among youth during the 1970's

ANNE MCDOUGALL YOUNG

The employment situation for 16-to-24-year-old youths enrolled in school was about the same in October 1979 as a year earlier. Among out-of-school youths, unemployment had risen for the first time since the 1974–75 recession.

The number of youths not enrolled in school who were in the labor force was about 200,000 higher in October 1979 than in October 1978,[1] mostly because of an increase in unemployment (table 1). Surprisingly, however, this rise in unemployment did not occur among the groups usually most susceptible to joblessness. Rather than affecting school dropouts, the increased burden fell primarily on high school graduates who had not gone on to college; their unemployment rate rose from 8.7 to 9.8 percent. Thus, while the proportion of workers with some college education was increasing in all occupational groups, the youths with no more than a high school diploma were apparently at some disadvantage during the uncertain economic conditions of autumn 1979.

There was little change over the year in the already high unemployment rate for high school dropouts, which remained at about 19 percent in October 1979. However, the number of employed youths with less than a high school education increased, particularly among those 20 to 24 years old. This may reflect, in part, the entry into the youth labor force of recent immigrants from less developed countries, many of whom have only a few years of formal schooling. (Data from the U.S. Immigration and Naturalization Service for fiscal year 1978 indicate that nearly 30 percent of the 601,000 legal immigrants were 20 to 29 years old.)[2]

Approximately 7.3 million youths, half of all students, were combining school and work in October 1979. Young women were about as likely as young men to be working or looking for work. Among younger students with jobs, most worked part time (less than 35 hours per week); among the older students, those 22 to 24 years old, about half worked full time (35 hours or more per week).

Black youths enrolled in school were much less likely than white youths to be in the labor market. Their labor force participation rate was almost 25 percentage points below that for white students at the high school level and over 10 points lower among those enrolled in college. These lower rates reflect, in part, the limited employment opportunities in the inner city, where blacks are concentrated, and the isolation of many black colleges in rural areas where the chances of employment are also slim. High unemployment rates among black students—triple those of white students—were also apt to discourage job seeking.

Recent high school graduates and dropouts

The high school graduating class of 1979 was the same size as in 1978—about 3.2 million. As in 1978, approximately half of these high school graduates had enrolled in college by October (table 2). The probability of going on to college after graduation from high school was nearly the same for women as for men and differed little between whites and blacks, these differences having gradually disappeared since 1970. However, even though the proportion of graduates entering college was about the same for all sex and minority groups, the proportion of 18-and-19-year-olds who were eligible for college was much lower among minority groups than among whites. Just 57 percent of the blacks and 54 percent of the Hispanics, compared with 75 percent of the whites in that age group, had completed high school. Overall, the proportion of young people enrolling in college immediately after high school graduation has been inching downward in recent years—from 51 percent in 1977 to 49 percent in 1979.

Labor force participation rates in October 1979 for recent high school graduates continued close to the peak levels reached in 1977—42 percent among those in college and 87 percent among those not in college. As might be expected, youth enrolled full time in college had a relatively low labor force rate of 39 percent, but the rate for part-time college students (84 percent) almost matched that of recent high school graduates no

longer in school. Unemployment edged upward among all recent graduates, whether or not enrolled in school.

Both the labor force participation rate and the unemployment rate for the approximately 800,000 youths who had dropped out of elementary or high school over the course of the year were about the same in October 1979 as in October 1978, at 66 and 26 percent, respectively. School dropouts were not nearly as likely to be in the labor force as youths of the same age who had graduated from high school. Also, the unemployment rate for dropouts was more than one and a half times that of graduates.

Changes over the decade

The 1970's have witnessed a sharp increase in the size of the youth labor force, not only because of population growth but also because of a substantial rise in the labor force participation rates of various youth groups. For example, in October 1970 there were about 18 million 16-to-24-year-olds in the labor force, or 59 percent of the group's population (table 3). As the decade was drawing to a close, the rapid growth of the youth population, fueled by the baby boom which followed World War II, was also coming to an end. Reflecting the rapid decrease in births which began in the early 1960's, the

number of youths under 20 years of age had already begun to decline. However, the youth labor force had continued to grow, having reached 24.3 million by October 1979, while the labor force participation rate for 16-to-24-year-olds had risen to 67 percent.

Whether because of inflation, peer pressure, desire for work experience, or other reasons, the proportion of students participating in the labor force rose about 6 percentage points for men and 10 percentage points for women during the 1970's. This growth largely reflects the recent enrollment increase in 2-year colleges. These students are much more likely to be in the work force while attending school than are students enrolled in 4-year colleges and universities.

Among whites, the increase in student labor force activity over the 1970's was evident both among young men and women. Among blacks, however, labor force participation increased only among women, but overall population growth for blacks was faster than for whites. As a result, blacks constituted about the same proportion of the student labor force in 1979 as in 1970.

Despite the increases in participation among students, it should be noted that 7 out of 10 of the 16-to-24-year-olds in the labor force were not enrolled in school either in 1970 or 1979. The labor force participation rates of the nonstudent youths, already relatively high in 1970, edged up slightly for men, from 92 to 93 percent, and increased sharply for women, from 60 to 72 percent. Delayed marriage and childbearing have contributed to the rise in labor force activity among these young women.[3]

Although high relative to the rates for other segments of the population, the unemployment rates for youths in and out of school were about the same or slightly lower in October 1979 than in October 1970, as shown below:

Characteristic	*1970*	*1979*
Enrolled		
Total	13.2	12.9
White	12.1	11.0
Black and other races	26.0	34.2
Not enrolled		
Total	10.9	10.8
White	9.7	9.2
Black and other races	18.8	23.1

The major exception was the situation among black youths; the unemployment rate of black students (34.2 percent in October 1979) had increased by about 9 percentage points over the decade, and the rate for those not enrolled (23.1 percent) was 4 percentage points higher than in 1970.

A striking feature of youth employment problems during the 1970's was that, unlike the previous decade, half of all unemployed teenagers were enrolled in school —mainly high school. For example, 42 percent of the unemployed black youths were in high school in October 1979—up from 34 percent 9 years earlier—as were 40 percent of the whites. The importance of determining the school enrollment status of unemployed youths in terms of public policy has been reemphasized by the National Commission on Employment and Unemployment Statistics. The Commission has recently recommended that youth enrollment status be determined each month in the Current Population Survey, rather than annually in October.[4] More frequent enumeration of the unemployed by school enrollment status would provide improved estimates of the number and type of jobs needed to relieve teenage unemployment. Certainly the unemployment problems of students, many of whom are seeking only part-time work, require very different poli-

cy approaches than do those of youths who have dropped out of school before high school graduation or who are graduates just starting their careers. ☐

FOOTNOTES

[1] This report is based primarily on supplementary questions in the October 1979 Current Population Survey, conducted and tabulated for the Bureau of Labor Statistics by the Bureau of the Census. Most data relate to persons 16 to 24 years of age in the civilian noninstitutional population in the calendar week ending Oct. 13, 1979.

Sampling variability may be relatively large in cases where the numbers are small. Small estimates, or small differences between estimates, should be interpreted with caution.

The most recent report in this series was published in the *Monthly Labor Review*, October 1979, pp. 34–38, and printed with additional tabular data and explanatory notes as Special Labor Force Report 223.

Research Summaries

How the disabled fare in the labor market

BARBARA L. WOLFE

Increasing attention is being paid to the disabled. Legislation has been passed requiring easier access to buildings; income maintenance plans now exist for those with reduced earnings capacity; there are training programs to improve the productivity of some of the disabled. Yet, little is known about the disabled. Who are they? Do they work, and where? Are they married? Are they as educated as the nondisabled? What is their economic position?

This report provides a description and some analysis of noninstitutionalized disabled persons ages 20 to 64. Emphasis is on labor force behavior, including amounts of work, occupational distribution, and wage rates.

The problem is widespread. Some 12 to 15 percent of the population in this age range is disabled. (The spread reflects differences in the definition.) This represents some 15 million prime-age adults. According to the 1972 Survey of the Disabled, musculoskeletal disorders (36 percent), followed by cardiovascular problems (21 percent), account for much disability. Considerably smaller amounts are accounted for by mental, respiratory, and digestive disorders. For some purposes, it would clearly be more interesting to study individually, each medically classified group. But, to get an overall, current view of the disabled, and to compare them to the nondisabled, in terms of socioeconomic well-being, a choice was made to use data that do not contain such medical information, but instead, focus on the overall socioeconomic picture.

The first part of this report presents the methods used to define the disabled. The second details who the disabled are.

Defining disability

One major difficulty in all research in this area is how to define the disabled. Some recent studies have used self-reported health status,[1] which emphasizes work limitation or self-assessed capacity for work.[2] This is tied to current program definitions that emphasize the long-run or chronic nature of the disability.

In this study the Current Population Survey (CPS) was selected because a recent data source is desirable. Also, the base should be one that is nationwide, representive, and contains both labor force and demographic information. These reasons made the most recent CPS most attractive for studying the disabled.

The CPS does not include as much information on disability as is available in alternative data sources. For example, there is no information regarding limitations in housekeeping. But there is information about whether the amount of work the disabled person can do is limited. In addition, the information on program participation makes it possible to identify some other members of the disabled population. Thus, it seems that the most recent CPS (1977) was perhaps the best suited data source.

The goal is to define all those who are disabled in a long-term sense—not just those who are working part-time or who are being served by a program for the disabled. The targeted group was restricted to the noninstitutionalized population ages 20 to 64 because younger persons are generally dependents or students, while those older are eligible for a wide variety of programs because of their age. Using the 1977 CPS, the disabled are defined by three basic categories: program participation, work limitation, and low wage and participation in a sheltered workshop occupation.

By program participation. There are a number of programs designed specifically for the disabled. Included here are those that provide income: disability benefits under social security; supplemental security income (SSI), an income-tested program; railroad disability annuities; workers' compensation; and disabled veterans' benefits.[3]

Seven percent of the population is defined as disabled, according to program participation (table 1). This includes 9.1 percent of men and 5.04 percent of women; 6.7 percent of white persons and 8.3 percent of nonwhite; and 4.5 percent of those ages 20 to 34, 5.6 percent of those 35 to 44, 8.6 percent of those 45 to 54, and 12.9 percent of the oldest age group, 55 to 64.

By work limitation. The individuals included here either do not work or are limited in the amount of work they

---

Barbara L. Wolfe is an assistant professor of economics and preventive medicine at the University of Wisconsin, Madison.

can perform.[4] This approach should include those who are unable to work or who are ill for substantial periods of time, while excluding those who missed work because of short-term, acute illnesses. By this definition, 6.9 percent of the population is disabled. This includes 7.5 percent of men and 6.3 percent of women; 6.3 percent of white persons and 11.1 percent of nonwhite; and 3.5 percent of those 20–34, 5.7 percent of those 35–44, 9.2 percent of those 45–54, and 14.1 percent of those 55–64.

The highest percentages of persons are designated "unable to work" on the basis of not working at all the previous year; the second highest percentages represent those who worked some last year. Unfortunately, the study directed no questions specifically toward limitations in housework, and the resulting low percentages of disabled women are probably largely the result of this.

By special work program. It is also desirable to include individuals who are in work programs designed especially for the disabled. Because many individuals may not respond to inquiries directed at work limitations, an additional definition is used; individuals whose wage rate is positive but less than $1 are included as disabled if their occupations are in sheltered workshops. This includes nonprivate housecleaning, food, health and personnel, certain laborers, some operatives, and certain sales and clerical workers. A total of 1.46 percent of individuals ages 20–64 are disabled by this definition.[5]

Using all of these definitions, 12.3 percent of the population ages 20–64 is disabled, or about 14.3 million individuals, slightly below the 14.6 percent (15.5 million) in the 1972 Survey of the Disabled (SDA). Most of the differences lie in the count of women: in the survey, 15.2 percent of women were classified as disabled, while here only 11.2 percent are classified as disabled. The comparative percentages for males are 14.0 percent for the SDA and 13.5 percent for W-CPS. The larger difference for women is probably related to the lack of information concerning housewives.

Table 1. Government program and labor force participation rates for the disabled

Category	Disabled as percent of population aged 20–64		
	Men	Women	Total
Total[1]	13.5	11.2	12.3
Programs			
Total	9.1	5.0	7.0
Supplementary Security Income	0.9	1.4	1.2
Social Security	3.0	3.4	3.2
Veterans Compensation	4.7	—	2.1
Workmen's Compensation	3.0	0.6	1.3
Reductions in labor force participation			
Total	7.5	6.3	6.9
Did not work: ill last year	4.2	3.6	3.9
Unable to work: last week	2.3	0.8	1.5
Worked some last year: ill	3.1	2.4	2.7
Worked some last week: ill	0.2	0.4	0.3
Low wage: Sheltered workshop occupation	1.0	1.9	1.5

[1] Nonadditive: many defined to be disabled by more than one definition.

In other respects, the two surveys show similar disability patterns: more of the disabled in the South than in the other major regions, fewer white persons than nonwhite, and a greater percentage among older age groups.

Characteristics of the disabled

The disabled population tends to be older, has a higher proportion of nonwhite persons, is less likely to work, and if working, less likely full time. The disabled are also less likely to be married, and tend to have less education than the nondisabled, and lower wages, even allowing for educational differences.

General characteristics. For both sexes, the probability of being disabled increases with age, the only exception being the close percentage of the two younger age-groups of men. (See table 2.)

The disabled have significantly lower educational levels (table 3), although the modes are the same for both (12 years). Some of the biggest differences occur at the very lowest levels of education—eight years and less; much higher percentages of the disabled are in this category. A comparison to the SDA is possible by including the educational distribution for this sample. It tends to show the same overall educational differences but does emphasize that the educational distribution has been increasing overall—the surveys are 1972 and 1977, and this holds for the disabled as well as nondisabled.

Marital status distributions (table 4) show lower current marriage rates among the disabled. This is emphasized by the large difference in the "being married-spouse present" category in the two populations—57.7 percent versus 72.3 percent.

The regional distribution shows that the proportion of the disabled population living in the South is greater than that of the nondisabled population, while it is less in other regions.

Labor force characteristics. If we broadly define labor force participants to include all those who, during 1976, worked or looked for work, or said they were unable to find work, 59 percent of the disabled were in the labor force. This compares with 80 percent of the nondisabled, or 78 percent overall. Among women, 53 percent of the disabled and 66 percent of the nondisabled were in the labor force. Among men, 65 percent of the disabled and 97 percent of the nondisabled were in the labor force.

Table 2. Percentage of population disabled, by age and sex

Age categories	Men	Women
Total	13.5	11.2
20–34	10.3	7.1
35–44	10.1	10.3
45–54	15.5	13.7
55–64	23.4	19.2

Except for white women ages 20–34, the nondisabled are more likely to be in the labor force. This suggests the difficulty in defining the disabled among women; many list their occupation as "housewife" and there is no way to discern who may be disabled.

The percentages in the labor force are large. It includes all those who worked in 1976, even briefly, or said they were unable to find work. About 1.05 percent of men and 1.13 percent of women were unable to find work. Among the disabled, the percentages are lower: men .98 percent and women .56 percent. But there is a difficulty—those unable to work. Adding the two percentages shows that 32.1 percent of disabled men and 32.4 percent of disabled women did not work either because they are unable or could not find work. This compares to 1.03 percent of nondisabled men and 1.2 percent of nondisabled women. By age, the percentages of these disabled individuals are:

	Men	*Women*
20–34	14.7	16.0
35–44	30.5	25.8
45–54	38.2	35.0
55–64	47.9	48.9

Thus, large percentages of the disabled population do not work because of their disability or lack of opportunities, and the percentage increases with age, for both sexes.

Full or part time. A detailed look at the amount of time spent working shows further differences between the disabled and nondisabled populations. Many more of the disabled do not work (36 percent of men and 47 percent of women, compared to 4 percent of nondisabled men and 36 percent of nondisabled women). A far lower percentage of the disabled work full time (30 percent of men and 11 percent of women, compared to 74 percent of nondisabled men and 33 percent of nondisabled women. These large differences suggest that transfer payments are important for the disabled.

Do the differences reflect handicaps that make it difficult to work, or lack of opportunity, or discrimination? They may also reflect that those with low opportunity costs, older persons with less education, for example, may be more likely to regard some physical or mental limitation as a disability, and to seek transfer payments.

One way of gaining some insight into this is to look at the wage rate of the disabled versus nondisabled population. The average wage rate is lower among the disabled. Of more interest, however, is wage rates according to educational level:

Years of education	*Disabled*	*Nondisabled*
Total	$2.57	$4.27
Less than 8	1.08	2.85
8	1.79	3.18
9–11	1.87	3.24
12	2.93	3.86
13–15	3.64	4.43
16 or more	5.07	6.73

Wage rates

Educational level. For every educational level, the average wage rate of the disabled population is below that of the nondisabled population. For all groups with less than 12 years of education, the average wage rate of the disabled is below the minimum wage. This may be partly because of individuals in sheltered workshops. However, even among those who have attended college, the differences are large. The jump in wage rates from 9 to 11 years of education to 12 years is much greater for the disabled, possibly suggesting a high return to education for the disabled; the disabled may have lower opportunity costs.

Part of the difference may reflect hours worked. On an average, the disabled who are employed work fewer hours, although the difference is small—all are close to 40 hours per week. Average number of workweeks show somewhat larger differences, especially for white persons, among whom the disabled work 40 weeks per year, and the nondisabled, 47. Thus the major participation decision seems to be whether to work rather

Table 3. Educational distribution for the disabled and nondisabled

[In percent]

Education	Disabled	Nondisabled	All
Current Population Survey, 1977			
Less than 8	15.7	5.2	6.5
8	10.1	5.2	5.8
9–11	19.7	14.1	14.8
12	33.9	40.9	40.0
13–15	13.4	17.6	17.1
16 or more	7.3	17.0	15.8
Survey of the Disabled, 1972			
Less than 8	21.9	6.1	8.4
8	12.3	6.7	7.5
9–11	21.2	15.5	16.3
12	29.6	41.7	39.9
13–15	7.8	15.5	14.4
16 or more	6.4	13.6	12.6

than the number of hours.

Another way of getting a better picture of wage rate differentials is to look at wage rates for full-time workers only, by educational groups. (See table 5.)

Among men who are full-time, full-year workers, the disabled earn, in general, less than 90 percent of what the nondisabled earn. The biggest difference is among the lowest educational group, where the disabled earn less than 80 percent of what the nondisabled earn. Similarly, among women who work full time, year round, the largest difference is also among the lowest educational group, where the disabled earn approximately half of what the nondisabled earn. In other educational groups, disabled women also do more poorly (relative to men) compared to their nondisabled peers, earning between 62 percent and 79 percent of what the nondisabled earn.

Racial differences. The average wage rate differences are substantial among the disabled and nondisabled men's groups when race is considered. Among the disabled, there are very large differences between white and nonwhite persons in the lower educational groups; for full-time workers, earnings of nonwhite persons are between 50 percent and 65 percent of earnings of white persons.

Among the nondisabled, there is a generally lower educational level among the nonwhite but no particular employment pattern according to education. Among women, there is a quite different pattern: within the disabled population, nonwhite women with 8 or fewer years of education earn less than white women with similar education, but they earn more with 1 to 3 years of high school through the highest educational levels. The pattern is similar among nondisabled women; nonwhite women earn less at lower educational levels than their white peers but more (though only slightly so) at higher levels of education.

Thus, among full-time, full-year workers there is evidence within each sex, educational, and racial group that the disabled earn less. It appears that individuals with more than one disadvantage are worst off—disabled nonwhite persons with low education—and perhaps women, for their wages are lower than those for men in every education category. In fact, except for the two lowest categories of nonwhite women compared to nonwhite men, nondisabled women have lower average earnings than disabled men.

Table 4. Marital status of the disabled and nondisabled according to Current Population Survey, 1977

[In percent]

Marital status	Disabled	Nondisabled	All
Married, spouse present	57.7	72.3	70.5
Married, spouse absent	1.1	0.8	0.8
Widowed	10.7	2.3	3.3
Divorced	9.2	5.9	6.3
Separated	4.9	2.6	2.9
Never married	16.4	16.2	16.2

Table 5. Average wage rates for disabled and nondisabled workers,[1] by education and race

Education	Disabled			Nondisabled

Wage rates within occupational categories may understate differences between the disabled and nondisabled because discrimination, and physical and mental disabilities may limit choice of occupation. Differences may also reflect less experience and levels of labor force participation.

By occupation. Table 6 shows average wage rates and occupational distribution by broad occupational groups, among men. Overall, the nondisabled have higher wage rates in all occupations, but the differences range from nearly the same rates, 2 percent to 50 percent greater than the wage rate in the disabled men's category.

Among white men, the wage rate of the nondisabled is higher in most occupations. The exception is service workers. Among nonwhite men, wages of the nondisabled are also higher in all but one occupational category: managers and proprietors.

Turning to the occupational distribution, one again notes the much higher percentages of disabled who do not work: 36.2 percent of all disabled men, 48.2 percent of nonwhite disabled men. Beyond this, the disabled men are less likely to be in prestigious occupations, such as professional or managerial, than the nondisabled. Note again the compounding effects of race and disability on the low probability of being in such an occupation.

Disability and deprivation

Thus, from the perspective of comparing the socioeconomic status of the disabled to nondisabled, a consistent picture emerges. The disabled are much worse off in terms of education, probability of working, occupation, and wage rates, despite controlling for many characteristics important in explaining differential

Table 6. Average hourly wage rates and occupational percent distribution of disabled and nondisabled men[1]

Occupation	All men				White men				Nonwhite men			
	Disabled		Nondisabled		Disabled		Nondisabled		Disabled		Nondisabled

[1] There may be bias in measuring disability among women; the definition depends partly on labor force participation. Thus, a comparison of disabled and nondisabled women might also be biased.

SOURCE: 1977 CPS tape.

wage rates. Adding race to the analysis suggests a compounding effect; the nonwhite disabled fare more poorly than their white counterparts. Thus, there is some evidence of labor market imperfections that negatively impact this large part of our population.

What we have then is a picture of a group far worse off than the nondisabled. And, this does not take account of pain and suffering—possible greater needs based on the disability—including medical care, help meeting day-to-day limitations on activities, psychological stress, and other hardships.

The incentives to qualify for a number of programs are clearly present for a number of disabled; they do have lower opportunity costs. Yet, a substantial number work full time and experience less success than their nondisabled counterparts. Perhaps help other than transfer payments needs to be stressed for this group. Laws on physical access, laws on discrimination, and training programs may be worth further investigation for the disabled. Others will continue to need income transfer policies. But perhaps most of all we should be aware that disability may interact with other labor market disadvantages—educational for example. Policies will be better designed if they are aware of these effects. ☐

———*FOOTNOTES*———

[1] See, for example, H. S. Luft, "The Impact of Poor Health on Earnings," *Review of Economics and Statistics*, 57:1, who used the 1967 Survey of Economic Opportunity Data.

[2] This is the basis for the 1972 Survey of the Disabled.

[3] Except for payments under social security and railroad retirement, individuals who receive any dollar benefits from one or more of these programs are generally designated as disabled. The exceptions include those receiving veterans' benefits, where only those who are veterans and nonstudents are designated as disabled. Among social security recipients ages 20–64, distinctions are made to designate the disabled: individuals 19–61 who are not students, students 23–61, and widows and individuals 19–59 who have no dependent children under 18. Of those receiving railroad benefits, those under 62 are classified as disabled if they are not retired. These distinctions are based on program eligibility. The 1977 CPS enables far better identification of recipients for many of these programs than earlier CPS surveys. For example, veterans' pensions and other payments are separated. The source for the definitions under social security and veterans' benefits is the U.S. Department of Health, Education, and Welfare *Social Security Handbook, 1974*, 5th ed.

[4] Individuals who do not work are so designated for one of two reasons: they did not work last year because they were ill or disabled (variable P133=1, 1977 CPS tape), or they are classified as unable to work on the employment status recode (variable P12=6). The latter variable is the one generally used by the Bureau of Labor Statistics.

Individuals are designated as "limited in amount of work" if personal illness is the reason they usually work less than 35 hours. This is done for two groups: one that worked some last week but less than 35 hours, and another that did not work last week (variable P18=2 and P19–20=10, or P23=2 and P21=1). Alternatively, they are designated as disabled if they work less than 50 weeks and most of the remaining weeks they were ill or disabled (P145=1). In a sense, this attempt to define an eligible disabled population is similar to that used by Projector and Murray in "Eligibility for Welfare and Participation Rates" (HEW 78–11776), Social Security Administration, who attempt to define those eligible for welfare by using the 1971 CPS. Their procedure for defining the eligible disabled population is by using persons who worked less than 50–52 weeks in 1970 because of illness.

Significant Decisions In Labor Cases

OSHA standards: the burden of proof

Although much of the controversy surrounding the Supreme Court's decision in the "benzene case" (*Industrial Union Dept., AFL–CIO v. American Petroleum Institute*[1]) has passed, the ambiguities of the result continue. The main opinion of the Court plurality, written by Justice John Paul Stevens, stated that the Occupational Safety and Health Administration had exceeded its statutory authority by reducing permissible exposure limits to benzene at industrial work sites without making a "threshold determination" that a significant risk was present at the original level. The result might place a greater burden of proof on a regulatory agency to justify its actions, but leaves unchanged (at least facially) an agency's ability to promulgate and enforce regulatory policy once the need for it has been demonstrated. Some feel that the narrow factual circumstances of the case should preclude any sweeping effects on other regulatory agencies. But, for OSHA, the additional time and effort required to justify standards could severely strain limited resources and may seriously diminish the agency's effectiveness in many areas.

Benzene, a colorless gas used in the manufacture of motor fuels, detergents, and pesticides, is highly toxic, producing an immediate effect on the central nervous system when inhaled. Benzene has long been considered carcinogenic. As early as 1928, industrial health experts were exploring the possibility of a link between benzene and leukemia; by the mid 1970's, a connection was clearly established. In 1977, OSHA issued an emergency standard lowering the benzene exposure limit from 10 parts per million of air to 1 part per million, stating that benzene had been shown to cause leukemia at levels below 25 parts per million and that reports had shown the lower level feasible for industry compliance.

Although no evidence indicated that leukemia occurred at the 10 parts per million exposure level, the agency's standard policy on carcinogens required the lowest feasible exposure in the absence of proof of a risk-free level of exposure. Equally, the industries involved had failed to prove to OSHA's satisfaction that there is a safe level of exposure to benzene below which no excess leukemia cases would occur.

The agency claimed authority for reducing exposure levels under Section 6 (b) (5) of the 1970 Occupational Safety and Health Act, which it felt authorized the Secretary of Labor to set the most protective standard "feasible" to ensure employee safety. The affected industries brought suit, and the Fifth Circuit enjoined operation of the lower exposure limit, ruling it was not supported by appropriate findings.

The Supreme Court's resolution of the case hinged on the relationship between the act's definition of an occupational safety and health standard and its provisions authorizing OSHA to regulate toxic substances. The act requires that any standard be "reasonably necessary and appropriate to provide safe or healthful employment and places of employment."[2] For toxic substances, however, the law appeared to require maximum protection for individual workers:

> The Secretary, in promulgating standards dealing with toxic materials or harmful physical agents under this subsection, shall set the standard which most adequately assures, to the extent feasible, on the basis of the best available evidence, that no employee will suffer material impairment of health or functional capacity even if the employee has regular exposure to the hazard dealt with by such standard for the period of his working life. Development of standards under this subsection shall be based upon research demonstrations, experiments and other such information as may be appropriate . . . other considerations shall be the latest available scientific data in the field . . . [and] the feasibility of the standards . . .[3]

In the opinion written by Stevens and joined by Chief Justice Warren Burger and Justices Potter Stewart and Lewis Powell, OSHA's authority to regulate toxic substances was declared constrained by the law's general requirement that all standards be "reasonably necessary or appropriate to remedy a significant risk of material health impairment." Only after such a threshold determination is made can the Secretary select "the most protective" standard "consistent with economic and technological feasibility." The standard should be geared to eliminate "significant risk of harm," Stevens wrote, but the statute was not designed to provide absolutely risk-free workplaces. In the absence of an explicit mandate, he concluded, Congress "requires the Secretary to undertake some cost-benefit analysis before he promulgates any standard."

"Significant Decisions in Labor Cases" is written by Gregory J. Mounts of the *Monthly Labor Review* staff. Kate Farrell of the University of Notre Dame, an intern with the *Review*, wrote the summary of *Industrial Union Dept., AFL–CIO v. American Petroleum Institute.*

Having defined the Secretary's power to promulgate regulations, Stevens turned to the question of proving "significant risk" when scientific knowledge is imperfect and risk unquantifiable. He found the burden of proof to be on OSHA "to show on the basis of substantial evidence, that it is at least more likely than not that long-term exposure to 10 parts per million of benzene presents a significant risk of material health impairment." In this case, Stevens wrote, "OSHA did not even attempt to carry its burden of proof." (OSHA's policy for carcinogens was to impose the burden of proof of "safe" exposure levels on industry.)

Both Stevens and Powell, in his separate concurring opinion, were careful to emphasize the discretionary power of the agency to set safety policy. Stevens wrote that the agency must determine what a "significant risk" is, but such a determination "will be based largely on policy considerations." Powell, stressing the necessity of intelligent cost-benefit analysis, conceded that "the decision that costs justify benefits is largely a policy judgment delegated to OSHA by Congress." Stevens, concluded that "so long as they are supported by a body of reputable scientific thought, the agency is free to use conservative assumptions in interpreting the data with respect to carcinogens . . ."

Justice William Rehnquist, whose concurring opinion was the decisive fifth vote in the 5–4 judgment, posed a more fundamental challenge to the regulatory powers of OSHA. Rehnquist held that in view of the seriousness of the issue in question—the trade-off between possible future deaths and present economic costs—Congress is best suited to make the choice; instead, it had improperly delegated its responsibility to the Secretary of Labor. Congress must delegate authority in areas where it has no expertise, he acknowledged, but it should "lay down the general policy and standards that animate the law, leaving the agency to refine those standards." Labeling the feasibility requirement for all OSHA standards a "legislative mirage," Rehnquist called for the invalidation of the law's provision concerning toxic substance regulation and the reassumption by Congress of the responsibility for critical policy decisions.

Justice Thurgood Marshall authored the dissent; joining him were Justices William Brennan, Byron White and Harry Blackmun. Charging that the plurality ignored the "plain meaning" of the 1970 act, Marshall identified the issue in question to be scientific uncertainty rather than the statutory authority of the Secretary. In the face of such uncertainty, the dissenting justices felt Congress had intended the Secretary to have the broad powers implied by the law for regulating toxic substances. Also disputed was the plurality's contention that OSHA had not carried its burden of proof; the dissenters pointed to the 50 volumes of data collected and the 2 weeks of hearings on the proposed regulation as evidence of OSHA's attempt to justify the 1 part per million regulation.

In addition to its impact on health standards, the Court's judgment could limit the scope of OSHA's job-safety regulations. Stevens' declaration that the Secretary "make a threshold finding that a place of employment is unsafe" before setting standards is fairly straightforward when the regulation is a generic health standard, such as acceptable atmospheric levels of benzene gas. But safety policies are considerably more complex, particularly in the more comprehensive programs designed to regulate specific workplaces (for example, the regulations for dock safety currently being developed by OSHA). If the Court's decision were strictly applied, OSHA might have to make a threshold determination for each standard within the overall program. Depending in the range of the program, this could involve prohibitive costs.

Constitutional quotas

In its continuing effort to clarify the constitutionality of racial quotas, the Supreme Court recently upheld the authority of Congress to remedy prior discrimination by imposing racial and ethnic quotas in allocating Federal money. As in prior rulings on racial quotas, the Court failed to achieve a majority verdict. Nonetheless, the three opinions among the six justices who voted to uphold Congress on this sensitive issue agreed, at least, that Congress may assign benefits based on racial and ethnic (and, perhaps, other) criteria whenever it makes a finding of past discrimination and tailors a preference scheme to correct that discrimination. (*Fullilove v. Klutznick*.[4])

The opinion of Chief Justice Warren Burger announced the Court's ruling, upholding the constitutionality of a 1977 law that set aside 10 percent of Federal public works contract funds (totaling more than $4 billion) for minority business enterprises—businesses controlled by "citizens of the United States who are Negroes, Spanish-speaking, Orientals, Indians, Eskimos, and Aleuts." The law required that the States, as recipients of grants under the law, assure the Secretary of Commerce that at least 10 percent of the amount of each grant would be expended for bona fide minority business enterprises. Administrative regulations were adopted under the law that permitted waiver of the quota requirement when enough minority firms were not available in an area or when such firms requested an "unreasonably" high price. White contractors challenged the set-aside provision as a violation of the equal protection guarantees of the Fourteenth Amendment to the Constitution.

Burger, joined by Justices Byron White and Lewis Powell, offered a lengthy explanation of Congress' power under the Constitution to spend money. Because

Congress has the power to regulate commerce and, thus, could have regulated the practices of private contractors to remedy past discrimination, Burger wrote, Federal lawmakers can pursue the same objective by inducing voluntary cooperation through spending policies. Congress also has the power to involve State and local governments in such remedial efforts under its mandate to enforce the Fourteenth Amendment by "appropriate legislation," he reasoned. Thus, Burger concluded that the remedial *objective* of the minority business enterprise provision was a legitimate application of Congress' Fourteenth Amendment authority to ensure that minorities were not denied equal protection of the laws.

Burger then turned to the question of whether the *means*—racial and ethnic quotas—employed by Congress to achieve such a legitimate objective passed constitutional muster. He cited earlier cases where judicial remedies for racial discrimination incorporated racial criteria; this has been permitted when either constitutional or statutory violations were found. Thus, Burger reasoned that, because Congress has the most comprehensive remedial power and because Congress had found evidence that the effects of racial discrimination existed in the award of Federal procurement contracts, Congress may act to alter the status quo when it seeks to fulfill a legitimate objective—such as the elimination of racial discrimination:

> Here we deal . . . not with the limited remedial powers of a Federal court . . . but with the broad remedial powers of Congress. It is fundamental that in no organ of government, State or Federal, does there repose a more comprehensive remedial power than in the Congress, expressly charged by the Constitution with competence and authority to enforce equal protection guarantees. Congress not only may induce voluntary action to assure compliance with existing Federal statutory or constitutional antidiscrimination provisions, but also, where Congress has authority to declare certain conduct unlawful, it may, as here, authorize and induce State action to avoid such action.

Burger also reasoned that other challenged aspects of racial and ethnic quotas were permissible under the Constitution—at least in this case. For example, he found that the reduction in benefits available to white contractors innocent of any prior discrimination was simply a "relatively light" burden that they must share. Congress had the power to assume that such firms "may have reaped competitive benefit over the years" because of the "virtual exclusion" of minority firms from similar contracting opportunities. Whether the remedy Congress fashioned was too broad or too narrow in its application to victims of prior discrimination could not be answered by this case, Burger declared. He felt that such challenges could only be decided based on the inclusion or exclusion of specific persons. But he did reason that the administrative framework based on the law provided adequate assurance that participation of minority firms in the program would not deviate from the remedial purpose of the law. Specifically, he cited the requirement that minority firms be "bona fide" (at least 50-percent owned or controlled by minorities), that this requirement was enforced partly through a complaint procedure, and that waiver of the quota was possible when minority contractors were unavailable or charged excessive prices.

Although Burger specifically avoided an examination of the quotas under the tests established by the Court's *Bakke* decision,[5] he concluded that the set-aside provision would "survive judicial review" in such an analysis. Justice Powell, in a separate concurring opinion, applied the *Bakke* analysis he had agreed to and found that Congress' race-conscious remedy was an appropriate and justifiable response because of a compelling governmental interest in curing the effects of prior racial discrimination.

Justice Thurgood Marshall, who was joined in a concurring opinion by Justices William Brennan and Harry Blackmun, agreed only with the result of Burger's opinion because he felt that the constitutionality of racial classifications should be reviewed on the basis of his concurring opinion in *Bakke*. There, he wrote that, if a racial classification designed to further remedial purposes serves legitimate government objectives and if the classification is substantially related to the achievement of those objectives, it is constitutionally permissible. Thus, Marshall would go substantially further than the Burger opinion by reasoning that racial classifications are not *per se* violations of constitutional equal protection guarantees and that race-conscious remedies are within the authority of Congress to correct social imbalances.

The significance of Marshall's opinion may be measured by the outcome of lower court decisions interpreting *Bakke*. In the past 2 years, lower courts have adopted whichever one of the three *Bakke* opinions that comes closest to their own views.[6] Thus, as with the quota issue involving school admissions, lower courts are free to adopt Marshall's more permissive constitutional analysis in future cases involving minority preference schemes used by Federal, State, or local governments in areas such as housing, employment, or education.

In dissent, Justice Potter Stewart (joined by Justice William Rehnquist) argued that the Constitution's requirement of equal protection means what it says—all racial classifications are intolerable. He wrote that Congress has no greater authority under the Constitution to impose detriments based on race than does the judiciary—and the latter is limited to remedying specific effects of illegal racial discrimination. Congress intended to compensate the "disadvantaged," but this does not permit an unconstitutional racial classification, Stewart concluded.

Justice John Paul Stevens, in a separate dissent, argued that the lack of precision regarding who had been disadvantaged made the application of a remedy to all minority business unconstitutional. He reasoned that there was no basis to the assumption that the minorities who owned or controlled contracting firms had been discriminated against.

> At best, the statutory preference is a somewhat perverse form of reparation for the members of the injured classes. For those who are the most disadvantaged within each class are the least likely to receive any benefit from the special privilege even though they are the persons most likely still to be suffering the consequences of the past wrong.

Pension liability despite disclaimers

Settling an issue of limited proportions under the Employee Retirement Income Security Act of 1974, the Supreme Court recently ruled that employers who terminated pension plans under the law prior to January 1, 1976 (when it became fully effective) can be held liable for employee benefits paid through ERISA insurance despite provisions in the terminated plan protecting the employer from such liability. (*Nachman Corp. v. Pension Benefit Guaranty Corp.*[7])

Writing for the narrow 5–4 majority, Justice John Paul Stevens found that disclaimers of employer liability in pension plans protect against any direct claims made by employees, but that even during the phase-in period of benefit insurance Congress intended employers to be liable for up to 30 percent of their net assets to compensate the ERISA insurance fund for benefits paid. Of the 136 pension plan terminations during the initial phases of the law (September 2, 1974 to December 31, 1975), 78 plans contained provisions disclaiming employer liability in the event of asset shortfalls.

The 1974 act established the Pension Benefit Guaranty Corp. within the Department of Labor to insure employees' "nonforfeitable" benefits against the possibility of insufficient plan assets in the event of termination. The Nachman Corp., which terminated its pension plan on December 31, 1975, argued that a plan provision limiting employee benefits to the assets of the plan (and disclaiming Nachman's liability for any additional amounts) made such benefits "forfeitable" and, thus, not insured under the law.

Stevens found that Congress had used the word "nonforfeitable" to describe benefits that were vested under the conditions of the specific plan. (Since January 1, 1976, the law has specified minimum vesting requirements for all plans.) He reasoned that an employee's claim to such benefits remained "unconditional" and "legally enforceable" against the plan regardless of an employer's protection against direct liability. "Nonforfeitable" describes the quality of an employee's right to the benefit, Stevens concluded, and a disclaimer of employer liability imposes no condition on rights created through vesting.

Stevens, who was joined by Chief Justice Warren Burger and Justices William Brennan, Thurgood Marshall, and Harry Blackmun, also pointed out that when Congress passed the pension insurance law it was aware that most plans contained disclaimers of employer liability. If such provisions prevented insurance coverage, he reasoned, ERISA protection would apply only to the few plans without such disclaimers and to those terminating because of employer insolvency. But because Congress included a reimbursement provision (creating employer liability for up to 30 percent of a firm's net assets) beginning on the first day of the law's operation, it clearly intended to insure benefits in plans where the employer had disclaimed liability, Stevens concluded.

In dissent, Justice Potter Stewart argued that the specific language in the Nachman plan disclaimed liability for the *plan* itself in addition to the disclaimer of employer liability. The lack of liability for the plan under contract law, he reasoned, should make vested benefits forfeitable under the initial phases of ERISA (and, therefore, uninsured) because such benefits are conditional and legally unenforceable. □

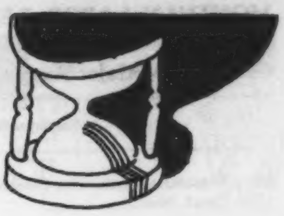
Major Agreements Expiring Next Month



This list of collective bargaining agreements expiring in October is based on contracts on file in the Bureau's Office of Wages and Industrial Relations. The list includes agreements covering 1,000 workers or more.

Employer and location	Industry	Union[1]	Number of workers
American Can Co. (Naheola, Ala.)	Paper	Paperworkers	1,600
American Chain & Cable Co., Inc. (Bridgeport, Conn.)	Fabricated metal products	Steelworkers	1,000
American Steel Foundries (Ohio, Illinois, and Indiana)	Primary metals	Steelworkers	3,800
Bendix Corp. Electrical Components Division (Sidney, N.Y.)	Electrical products	Machinists	1,950
Boeing Co. (Interstate)	Transportation equipment	Machinists	30,000
Boeing Co., Boeing Vertol Co. Division (Delaware and Pennsylvania)	Transportation equipment	Auto Workers (Ind.)	2,500
Commercial Shearing, Inc. (Ohio, Illinois, and Utah)	Fabricated metal products	Steelworkers	1,250
Consolidated Gas Supply Corp. (Interstate)	Utilities	Service Employees	1,450
Cyclops Corp., Empire-Detroit Steel Division (Mansfield, Ohio)	Primary metals	Steelworkers	1,150
Duval Corp. (Arizona)	Mining	Steelworkers; Operating Engineers; Laborers; and Teamsters (Ind.)	1,700
First National Stores, Inc. (New York and New Jersey)	Retail trade	Food and Commercial Workers	1,400
General Dynamics Corp., Quincy Shipbuilding Division (Quincy, Mass.)	Transportation equipment	Marine and Shipbuilding Workers	2,000
Great Atlantic & Pacific Tea Co., Inc., Indianapolis-Louisville Division (Indiana and Kentucky)	Retail trade	Food and Commercial Workers	1,800
Greyhound Lines, Inc. (Interstate)	Transit	Amalgamated Transit Union	13,000
Hershey Foods Corp. (Hershey, Pa.)	Food products	Bakery and Confectionery Workers	2,300
Hughes Tool Co. (Houston, Tex.)	Machinery	Steelworkers	3,700
Ingersoll-Rand Co. (New Jersey and Pennsylvania)	Machinery	Steelworkers	1,950
Koppers Co., Inc., Metal Products Division (Baltimore, Md.)	Machinery	Machinists	1,500
Libby-Owens-Ford Co. (Interstate)	Stone, clay, and glass products	Glass and Ceramic Workers	7,500
Lincoln Telephone and Telegraph Co. (Nebraska)	Communication	Communications Workers	1,500
Lockheed Aircraft Corp., LMSC Division (California and Florida)	Ordnance	Machinists	5,650
Lockheed Aircraft Corp., Lockheed Georgia Co. Division (Interstate)	Transportation equipment	Machinists	5,550
Lone Star Steel Co. (Dallas, Tex.)	Primary metals	Steelworkers	5,000
McDonnell Douglas Corp., Douglas Aircraft Co. subsidiary (California and Florida)	Transportation equipment	Machinists	5,100
McDonnell Douglas Corp., Douglas Aircraft Co. subsidiary (Long Beach, Calif.)	Transportation equipment	Auto Workers (Ind.)	9,900
McLouth Steel Corp. (Trenton, Mich.)	Primary metals	Steelworkers	3,700
Midland-Ross Corp., National Castings Division (Sharon, Pa.)	Primary metals	Steelworkers	1,050
National Standard Co. (Interstate)	Primary metals	Steelworkers	1,200
Ohio Ferro-Alloys Corp. (Ohio and Alabama)	Primary metals	Steelworkers	1,000
Olin Corp. (Pisgah Forest, N.C.)	Paper	Paperworkers	1,850
Outboard Marine Corp., Johnson Outboard Division (Waukegan, Ill.)	Machinery	Independent Marine and Machinists Association	3,400
Owens-Illinois, Inc. (Vineland, N.J.)	Stone, clay, and glass products	Flint Glass Workers	1,100
Revere Copper and Brass, Inc., Rome Division (Rome, N.Y.)	Primary metals	Mechanics Educational Society	1,400
Southern California Shoe Manufacturers Association, Inc. (California)	Leather	United Shoe Workers	1,100
Star Supermarkets, Inc. (Rochester, N.Y.)	Retail trade	Food and Commercial Workers	1,650
Titanium Metals Corp. of America, Standard Steel Division (Burnham, Penn.)	Primary metals	Steelworkers	1,650
Walt Disney World Co. (Orlando, Fla.)	Amusements	Service Trades Council Union	4,650

See footnotes at end of table.

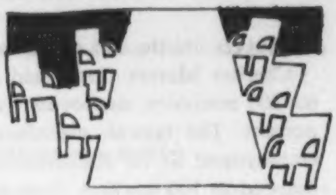
Klein Award contributions

The Trustees of the Lawrence R. Klein Award Fund recently made their 19th award to an author of a *Monthly Labor Review* article. The awards are presented annually for articles which (1) exhibit originality of ideas or method of analysis, (2) adhere to principles of scientific inquiry and (3) are well written. Initially $100 each, the awards now carry a $200 stipend.

The award fund was established by Lawrence R. Klein, who was Editor in Chief of the *Review* for 22 years until his retirement in 1968. Instead of accepting a retirement gift, he donated it and matched the amount collected to initiate the fund. Since then, he has contributed regularly, as have others. Among the latest to donate their retirement gifts have been John H. Chandler, former chief of the Bureau of Labor Statistics' Division of Foreign Labor and Trade, and Edgar Weinberg, former Deputy Assistant Commissioner of the Bureau of Labor Statistics' Office of Productivity and Technology.

Contributions to the fund are tax deductible and may be sent to Ben Burdetsky, Secretary-Treasurer of the Lawrence R. Klein Fund, c/o School of Government and Business Administration, The George Washington University, Washington, D.C. 20052.

Developments in Industrial Relations



Actions taken to aid auto industry

Moves to aid the automobile industry included a plan announced by President Carter to counter declining sales and increasing unemployment; approval of Chrysler's loan guarantee followed by renewed doubts about the company's viability; formation of an 11-union coalition to attempt to curtail imports; and further announcements of cost reduction measures by domestic manufacturers.

President Carter described the proposal to aid the auto industry as "a first step" in a "permanent partnership" between Washington and Detroit. The plan was outlined in a meeting with the heads of five automobile companies and Auto Workers President Douglas A. Fraser and drew a mixed reaction. The industry officials favored most aspects of the plan, particularly the idea of establishing a permanent Automobile Industry Committee of management, labor, and government representatives to study further steps to aid the industry. (This committee is similar to a tripartite committee established in the steel industry in 1978.) Fraser termed "very significant" the President's announcement that he would ask the U.S. International Trade Commission to expedite its decision on the UAW's June petition for a ruling on whether the increasing level of imports is harming the domestic industry and, if so, whether import restrictions should be imposed.

Other parts of the plan would

- Ease a requirement that all 1984 cars meet exhaust requirements for high altitude operation.
- Change standards of the Occupational Safety and Health Administration to permit companies to counter the dangers of exposure to lead and arsenic by having employees wear individual protective equipment, rather than by removing the hazard.
- Ease Environmental Protection Agency rules to reduce the number of cars that must be tested prior to the start of full-scale production and, in some cases, to allow production to begin without prototype vehicles first being made.
- Establish a program under which the Small Business Administration will guarantee working capital loans for 95 percent of the Nation's automobile dealers.
- Allocate $100 million of Economic Development Administration funds during fiscal 1981 to aid communities severely harmed by industrial dislocations, with at least half of the amount to be reserved for communities hurt by the transitions in the automobile industry.

The first result of the $1.5 billion Federal loan guarantee for Chrysler Corp. came when the company borrowed $500 million from a group of banks. The loan was made after the Government's Chrysler Loan Guarantee Board, which had earlier approved the overall guarantee plan, gave its required approval to the loan. A few weeks later, the board approved an additional guarantee of $300 million, as Chrysler reported a loss of $1.017 billion for the first half of the year, reportedly the largest loss ever suffered by an American corporation for a half year. The $300 million guarantee included $50 million to be available only if Chrysler obtained a matching $50 million of nonguaranteed loans. Treasury Secretary G. William Miller, who heads the board, released a study by the board's staff which forecast that the company will have to borrow a total of $1 billion in 1980, instead of the $800 million originally forecast, and $200 million in 1981, instead of $300 million.

In another area, Chrysler's board of directors formed a five-member committee "charged with insuring that every possible action is taken to alleviate the impact on the workers, the community in which the plant is located, and the government units involved" in any future plant closings. The action was proposed by Auto Workers President Fraser, now a Chrysler board member.

The company and the union announced plans to set up joint "quality action teams" to help resolve any quality problems at the two plants producing the company's new line of compact cars. The quality committees at the Newark, Del., and Jefferson Street (Detroit) plants are similar to more general cooperative programs established in recent years at Ford Motor Co. and General Motors Corp.

There were announcements of further employment cutbacks in the industry. Ford announced that by yearend an unspecified number of its salaried employees would join the 6,100 already on layoff. Prior to that reduction, Ford had about 88,000 salaried employees.

American Motors Corp. announced that it would reduce its white-collar staff by 10 percent, or about 700

"Developments in Industrial Relations" is prepared by George Ruben and other members of the staff of the Division of Trends in Employee Compensation, Bureau of Labor Statistics, and is largely based on information from secondary sources.

employees, by the end of summer.

Checker Motors Corp. said it had cut the salaries of its 200 nonunion employees by approximately 10 to 15 percent. The taxicab manufacturer reported that total employment at its Kalamazoo, Mich., plant had been reduced to 500 workers, from a normal 1,000.

The Auto Workers campaign to restrict automobile imports was strengthened when 11 unions of the Industrial Union Department of the AFL-CIO formed the Coalition of Auto Components and Supply Workers. According to Elmer Chatak, secretary-treasurer of the IUD and a chief spokesman for the coalition, about 650,000 workers in the automobile components and supply industry have lost their jobs—about twice the number of workers who have lost jobs at the automobile assembly companies. Chatak also said that the slump in domestic car production may be part of a permanent structural change in the industry, rather than a temporary slump, "unless President Carter takes immediate action to curb imports."

The coalition called on the President to impose a 5-year quota on auto and truck imports limiting the number to the 1975-76 levels of 1.7 million units a year. According to the IUD, 2.4 million vehicles are entering the country each year, amounting to 28.4 percent of all sales in the United States.

Uniroyal workers accept pay cut

There were several adverse developments in the tire industry, resulting from the slump in domestic car sales, reduction in driving attributable to increased fuel costs, and the switch to longer wearing radial tires. At Uniroyal, Inc., workers represented by the Rubber Workers agreed to a 12- to 13-percent cut in wages and benefits after the company had imposed the same reduction on its nonunion employees. (A combined total of 37,000 workers was affected.) Uniroyal said the action was designed to "pare costs to combat the effects of the recession." The company, which lost $120 million in 1979, also announced the closing of its bias-tire plant in Chicopee, Mass., which employs 1,600 people. Talks were under way between the company and a prospective buyer. Production workers at the facility reportedly were willing to accept a cut in pay to assure continued operation.

Firestone Tire & Rubber Co. announced that it would end quarterly cost-of-living adjustments for its 20,000 nonunion salaried employees. The employees would continue to receive the $350-a-month in adjustments that accumulated since Firestone started the quarterly adjustments in April 1977. Jack Miller, Firestone coordinator for the Rubber Workers, said that the company had not asked for a concession from the union but he did not rule out the possibility.

Anti-inflation plan pay standard changed

The Council on Wage and Price Stability announced a revision in the Carter Administration's voluntary anti-inflation plan. The revision permits union-represented employees to receive a wage and benefit increase of up to 10.5 percent in any contract year, if the average annual rate of increase over the entire contract term falls within the existing 7.5- to 9.5-percent standard. Previously, the 7.5- to 9.5-percent guideline applied to each year.

The change, retroactive to October 1, 1979, was backed by the Pay Advisory Committee, which contended that contract bargainers needed the additional flexibility in arranging their contract packages.

Southern textile workers get pay raise

Several major textile companies in the South announced wage increases for their employees. The size of the increase was not disclosed, but Burlington Industries, Inc., said that the raise for its 46,000 employees varied "to some degree" among its various divisions "since they are different types of operations." One firm, Chatham Manufacturing Co. of Elkin, N.C., announced that its increase was 10 percent. The last round of increases in the industry was in July 1979.

Among the other companies granting increases were Cone Mills, Inc., Spring Mills, Inc., and West Point Pepperell.

The Amalgamated Clothing and Textile Workers Union, which represents about 10 percent of the 280,000 textile workers in the south, settled with Fieldcrest Mills, Inc., on a 10-percent wage increase for more than 7,000 workers in North Carolina, Virginia, Georgia, and Alabama. The increase was negotiated under a wage-reopening provision of a contract scheduled to expire in 1981. The union also settled with Cone Mills, Inc. on a 9.5-percent general wage increase, an additional amount equal to 1 percent of payroll to be used to reduce or eliminate wage inequities among jobs, and an increase in company financing of pensions.

Firestone accused of 'affirmative action' failure

The Department of Labor barred Firestone Tire & Rubber Co. from doing business with the Federal Government, contending that the company had failed to implement an acceptable affirmative action plan to increase the number of minorities and women employed at the Firestone Petrochemical Center in Orange, Tex. Department officials said that the order ended some $40 million a year of company sales to the Government, making it the largest purchase cutoff under authority of Executive Order 11246, which bars discrimination by

Government contractors. The record had been held by Uniroyal, Inc., which settled its discrimination dispute in 1979. (See *Monthly Labor Review,* February 1980, p. 17.)

Firestone officials said the ruling would be appealed in the Federal courts, and that the action was based on "an unreasonable interpretation of a technicality in the law, and not on any pattern of discrimination as such." They claimed that the company has had an affirmative action plan at the facility for more than 10 years and that about 25 percent of its 650 employees were women or minorities.

Another Federal discrimination case ended when Philadelphia agreed to hire women for 30 percent of the next 2,670 vacancies in its police patrol ranks and to promote women to the next 16 detective openings and the next 17 sergeant vacancies. The consent decree, signed by the city and the Department of Justice, ended a discrimination suit filed in February 1974. The city also is required to pay $700,000 to 96 female police officers who were victims of alleged discrimination in promotions. Some of the women will receive as much as $22,488.

The city, which now has 186 female police officers, had been permanently enjoined against discriminating against women in the police department after a 1979 trial in U.S. District Court in Philadelphia.

President of seafarers union dies

Paul Hall, who was one of the original members of the Seafarers and rose to become president of the union, died at the age of 65. Hall also was the senior member of the AFL–CIO's Executive Council and president of its Maritime Trades Department.

AFL–CIO President Lane Kirkland and Secretary-Treasurer Thomas R. Donahue said that Hall's imprint could be found on many of the programs and policies of the Federation, citing his contributions to the growth and vitality of the Maritime Trades Department and to the improvement of labor-management relations in the industry.

Vice President Frank Drozak, who has been acting head of the union since Hall was hospitalized in November, will continue in that capacity until an election is held later this year.

Two railroad and airline unions merge

The 8,000 member Railway and Airway Supervisors union is now a division of the Railway, Airline and Steamship Clerks. Railway and Airline Supervisors President Frank J. Ferlin, who heads the new division, said that "given all the changes in today's industry, including a trend towards consolidation of railroads and airlines, we believe the interests of our members can better be served by joining forces with a larger organization." The Railway, Airline and Steamship Clerks, headed by Fred J. Kroll, had 200,000 members prior to the merger.

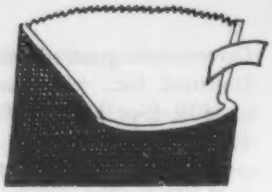
Boycott called off against southern chain

The Food and Commercial Workers union called off its 3-year boycott campaign against Winn-Dixie, Inc., after the parties agreed to rules governing some aspects of the union's efforts to organize the supermarket chain. According to the company, both parties agreed to conduct future representational or organizational campaigns in accordance with National Labor Relations Board rules and Federal law and to engage in informal discussions before exercising legal rights to contest any elections certified by the Board. However, company president Bert L. Thomas said that "we will continue to oppose with every proper and legal means any efforts by unions to organize Winn-Dixie employees." Jack Jones, the chain's director of industrial relations, commented, "the boycott hasn't affected us."

During the boycott campaign, the various participating unions charged that Winn-Dixie has an anti-union policy dating back to the 1950's and had repeatedly ignored rulings by the NLRB and Federal courts.

The Food and Commercial Workers officials said that since the start of the boycott the union has won representation elections at Winn-Dixie facilities in Asheville, N.C., Jacksonville, Fla., and Atlanta, Ga. Winn-Dixie's 1,300 stores and 52,000 employees are concentrated in the South.

Book Reviews



Evolution in medical science

Medicine and the Reign of Technology. By Stanley Joel Reiser. New York, Cambridge University Press, 1978. 317 pp. $15.95.

This book, by Stanley Joel Reiser, traces the evolution of medical instruments, the clinical laboratory, and the hospital and the profound changes in diagnostic methods this evolution has wrought. Yet, the author offers more than a history. The very title of the book implies the critical theme that pervades it. The author is concerned not only with the possibilities of medical technology, but also with its limitations and degenerative potential.

At first, medical instruments merely enlarged the physician's perceptual faculties. His judgment derived from his observations and experience. Increasingly, medical instruments became measuring devices. Chemical analysis, routinized with the development of clinical laboratories, became an indispensable part of the diagnostic effort. Radiology permitted the nonintrusive study of anatomy and morphology. The computer appeared to make diagnostic syntheses possible, which conventional medical records, with their large lacunae, preclude. Thus, the physician's judgment came to be more and more shaped by objective tests and data. Diagnostic methods became increasingly complex, fostering specialization, and the general practitioner declined in relative importance. This development resulted in an ever more tenuous relationship between physician and patient—an estrangement which, in turn, threatens the very reliability of the diagnostic methods the evolution of medical technology had been expected to enhance. This is the major theme of the work.

Reiser devotes but a brief chapter to the techniques of patient examination used in earlier centuries. His story really begins with the 19th century, when effective diagnostic instruments were first invented. Of course, knowledge of anatomy and physiology antedated these inventions. Dissection was performed and pathologies classified as early as the 16th century. But no consensus emerged regarding the relation between pathological examinations of cadavers and the symptoms of the living patient. The practicing physician of the 17th and 18th centuries typically analyzed his patient's description of his illness and observed his patient's symptoms, but he did not examine him physically. He eschewed manual methods as being "beneath his dignity"; it would place him on a par with the surgeon, who usually lacked academic credentials and background in medical theory.

The principle of physical examination as the keystone of diagnosis encountered great resistance, and was debated for decades, before it came to be firmly established around 1850—and then mainly as a result of the proliferation of instruments which revealed the relation between symptom and disease. For example, the diagnostic value of sounds generated by the heart or by breathing was now explored by the stethoscope, the findings of which were eventually confirmed by autopsies. According to Reiser, the stethoscope, invented in 1819, represented the first major step towards basing medical practice on scientific findings. While medicine had indeed evolved as a distinct science since the days of Fernel, Vesalius, and Harvey in the 16th and 17th centuries, the gap between medical theory and medical practice began to be closed only in the early 19th century.

The stethoscope also initiated the breakdown of the doctor-patient relationship. The patient's own account of his symptoms and experience with illness began to diminish in importance. The stethoscope and the instruments that succeeded it generated a "model of disease" which often differed from the patient's explanations. Nevertheless, acoustical and visual methods of examination (for example, the ophthalmoscope, the laryngoscope, X-rays) might still be considered as belonging, as it were, to the handicraft stage of medical practice—they were tools applied by the physician, not testing devices. They altered his view of the causes and location of disease, but did not give the precision to his findings which subsequent inventions would. Furthermore, the focus of medical diagnosis was still gross anatomy—the diseased part rather than the disturbed function, the visible tissue rather than tissue cells invisible to the naked eye.

The single most important instrument underlying the transformation of diagnosis was the microscope. The microscope had been invented in the 17th century, but the microstructures and microlife it revealed were not linked to disease by its inventors or by its students until the mid-19th century. Only then, after severe problems of distorted images had been overcome, did some physicians urge its use in tissue analysis. Only then was disruption of the function of the cell—which had been discovered long before—recognized (by Rudolf Virchow) as the basis of disease. The discovery by Rudolf Koch and Louis Pasteur that micro-organisms could cause disease and the development of bacteriology as a science was a result of the microscope.

The microscope, like other diagnostic instruments, was at first still associated with anatomical concepts. Yet, many physicians urged that changes in natural functions, such as breathing, blood circulation, and temperature also be read as indicators of pathology. This view was promoted by the invention of measuring and graphing devices, such as the sphygmometer and the sphygmograph between 1836 and 1860 (these devices measure the pulse rate). The sphygmograph "transformed the subjective character of pulse feeling into an objective, visual, graphic representation that was a permanent record of a transient event, amenable to study and criticism alone or by a group of physicians." Such devices—and here they also include the thermometer, the electrocardiograph, the microscope, and later the X-ray tube—were no longer mere tools or aides to the physician's perceptions. They were akin to machines, with outputs no longer directly dependent upon the skills of their operator but with skills built into them. Furthermore, they engendered some of the consequences associated with machines; in time, they gave rise to the norming of such "output" variables as blood pressure, body heat, and pulse rate. Being complex apparatus, they required specialization, thus encouraging the practice of delegating medical tasks to health specialists other than physicians (in 1900, of 200,000 such workers, 60 percent were physicians; in 1969, of 1.7 million, 20 percent were physicians); in addition, they contributed to the centralization of medical care in urban hospitals. Equally, they radically eroded the relationship between physician and patient.

These developments were promoted by the rise of chemical analysis of bodily fluids and tissues. Unlike the diagnostic instruments discussed by Reiser, chemical analysis evolved in a distinct institutional context, the laboratory, "the organized workshop of science where investigators analyzed the objects of their interest firsthand," which was largely a creation of the 19th century (being essentially conceived by Justus Liebig, the great German chemist). Reiser devotes but a few pages to the laboratory, and does not fully explore its significance. The laboratory created a new environment, unimpeded by tradition and convention, for research, which must have contributed to its productivity in terms of the basic knowledge it produced. The laboratory not only accentuated the trend toward separation of patient and physician, but also began to sever medical knowledge from medical practice.

The specialization and professionalization of medical practice that arose from the evolution of medical technology and knowledge created an ever more refined division of labor among health workers. The hospital and group practice institutionalized this division of labor. "(By) the 1930's, a number of leaders in medicine looked to hospitals, and the cooperative model of practice, as the key to reorganizing the practice of medicine . . . The . . . Committee on the Costs of Medical Care . . . proposed turning hospitals into comprehensive centers that would be the focus of all medical activities." The hospital proved to be a far more potent centralizing agent than group practice. In 1929, 8 out of 10 physicians were affiliated with a hospital; 1 out of 25 maintained offices or hours there. By 1975, virtually all practicing physicians were affiliated, and 1 out of 4 practiced full-time there. The professional necessity of such affiliation is indisputable, but affiliation surely helped congeal the corporate interests of physicians.

In the final third of the book, Reiser offers a searching critique of what he regards as excessive reliance upon medical technology, and the consequences for medical practice and practitioners. He cites the enormous increase in the use of laboratory tests, X-rays, and other diagnostic procedures in the face of their often doubtful utility; the steep resulting rise in costs and, most important to him, the tendency to substitute such tests for the physician's own perceptions and judgment. The patient's subjective symptoms and comments have, as a result, been ignored, history-taking has declined in importance and, hence, medical thought has lost coherence; medical practice has been "decerebrated."

The author did not perhaps fully appreciate the depth of the gap between the two parts of his work. The history of the technological and medical developments presented in the first part does not prepare the reader for the disturbing critique advanced in the second. The creation of a scientific, objective basis of medical diagnosis, made possible in large part by an evolving medical technology, could not but change the relationship between physician and patient, voiding it of some of its human concerns. But why should medical technology have come to dominate medical practice, rather than serve it? Why should it have engendered "an attitude in which the patient (is) less than a person and more of an object"? Reiser does not explicitly address these questions. He mentions such factors as preoccupation with scientific apparatus as supposedly embodying the "spirit of science," the emphasis on laboratory techniques and biology in physicians' training, broader insurance coverage, and the threat of malpractice suits. But these are conditioning, rather than casual factors.

One of the fascinating aspects of the book is that the author does not simply describe the progress of medical technology and diagnosis, but that he also carefully details the professional resistance to it, as well as the frequent unreliability of early generations of instruments—all of which hindered the ready adoption of given technologies and diagnostic concepts. There is, thus, at least a hint of a corporate interest on the part of the medical profession in then existing modes of diagnosis. The rise of the hospital as a central and centralizing institution of medical practice undoubtedly accentuated the corporate interest of the medical profession. The huge investment in complex equipment and lengthy specialized study further solidified this interest, also imparting to it a large economic dimension. It is certainly true that changing conditions eventually compel a redefinition of interest, but they must then match the stakes involved, and these are very great now.

After the end of World War II, some physicians reflected on the one-third rejection rate of men called to service, because of neuropsychiatric disorders. They began to consider disease "as a maladaptation to biological, familial, and environmental circumstances—as disturbances of thoughts, feelings and social relationships as well as disturbances of tissues and bodily fluids . . . " Nevertheless, "the view of man as primarily a physico-chemical organism has remained the dominant view of postwar medicine . . . " That view of course remains anchored in existing health care institutions. The reign of medical technology, of which Reiser gives such a superb account and which so deeply troubles him, seems destined to institutionalize the physico-chemical approach to diagnosis for decades to come. For, judging by Reiser's own testimony, medical technology is in large measure conceptually based upon that approach, and in turn it generates professional and corporate interests that are hard to dislodge.

Myth-making and myth-breaking

The Economics of Sex Differentials. By Cynthia B. Lloyd and Beth T. Niemi. New York, Columbia University Press, 1979. 355 pp. $16.50.

During the past quarter century, changes in social attitudes, life styles, marital and family patterns, and a host of other developments have contributed to a dramatic increase in the labor force participation of women. Since 1950, the proportion of women engaged in or seeking market work has climbed from about one-third to more than one-half. During the most recent decade, the increase has been concentrated among young women—those under 35 years of age—and the traditional separation of market work and home production has become less sharp for young wives and mothers. Prior to the midsixties, the bulk of the growth in female labor force participation had occurred among those 45 to 59 years of age, a group that had largely completed the time-consuming portion of their child-rearing responsibilities. The return of these middle-aged women to the paid-work force had required fewer adjustments by their families, the social structure, and their employers, since, on average, this group was less career oriented than the younger women who followed them into the job market.

It is against this backdrop of social, economic, and political developments that this book, by Cynthia B. Lloyd and Beth T. Niemi, was written. It takes its place among a raft of articles, speeches, and books that have been written on the subject.

Unfortunately, the large quantity has not always been of the highest quality, so it is with much appreciation that this work by two well-qualified economists ought to be received. Unlike much of the literature in this area, this work is even-handed in tone, neither strident with political overtones nor so overloaded with details that it can be read only by specialists in the field. The first chapter, in particular, should be required reading for every person interested in the subject. Academics, journalists, policymakers, and the public at large can all benefit from this careful discussion of the myths and reality of the current situation.

Among the subjects discussed in this chapter are various misinterpretations of statistical data including: the drawing of conclusions about individual behavior based upon group averages, the expectation that cross-sectional data can be used as a proxy for developments over time, and the attribution of too much weight to anecdotal evidence. When employers or policymakers fall prey to these misinterpretations, they may well perpetuate the problems that they perceive.

In regard to the use of statistical averages, the authors point out the fallacy of drawing conclusions about individuals based upon group norms by illustrating the amount of dispersion around the averages. They then discuss the "statistical discrimination" which occurs when an employer chooses not to hire a particular woman, because he has read that women, on average, have higher turnover than men. The specific man that is hired may or may not stay at the job longer than the woman who was avoided; she was never given the opportunity to begin her tenure. Actually, the data show that women's rates of turnover are not greatly unlike men's if one controls for age and occupation.

Another common misunderstanding results from a confusion between cross-sectional and time-series data. As the authors put it:

> The dramatic increase in labor force participation rates among women of all ages, but particularly among younger

> women, in the last 10 years have meant that for the young cohorts of women (that is, women born in the same year), labor force participation rates appear to be rising almost continuously over the life cycle. This presents a sharp contrast to the cross-sectional picture, which implies that women are dropping out in their child-bearing years. The deception arises because the labor force behavior of different women of varying ages is being used to simulate the life cycle of a hypothetical woman. However, because of dramatic changes in behavior among younger women, it is not accurate to look at older women today and assume that that is where younger women will be a certain number of years down the road.

A related misconception occurs when someone believes that a rate for a particular group at a particular time can be used as a proxy for the overall behavior of a "typical" member of that group. For example, a labor force participation rate of 50 percent means that half of the relevant group is currently in the labor force, not that a typical member of the group spends half of her lifetime in the labor force. The authors cite an actual longitudinal study which suggests that one-third of all women work just about continuously, one-third intermittently, and one-third never work outside the home.

Misunderstandings of the nature of change sometimes result from the use of anecdotal evidence. These examples, which are often used in popular press, may overstate the amount of change that has actually occurred. For example, female carpenters, crane operators, and mineworkers are interviewed and some observers conclude that such occupational choices have become commonplace. While it is true that there have been some women who have been able to move into traditionally male occupations, most women remain in those fields that are predominately female. Six out of every 10 women are in retail trade, clerical, or service occupations. Specific occupations that are at least 90 percent female include secretaries, bank tellers, cashiers, and nurses; occupations that are less than 10 percent female include mechanics, carpenters, dentists, and engineers.

It is important to correct misconceptions concerning women in the work force for several reasons. First, accuracy in understanding the world around us enables individuals to better plan their lives. Second, the behavior of individuals is dependent on their beliefs concerning the facts, and their misunderstandings may serve to be self-fulfilling. An employer may be reluctant to invest in training for a female employee if he believes her likely to leave; without training to improve her skills, she may have little incentive to stay. Lastly, policy decisions based on traditional assumptions tend to foster and perpetuate a situation that might otherwise change. Often cited examples relate to tax policies and the structure of social security benefits.

The remaining chapters of the book are amplifications of the foundation chapter, providing theory, data, and analysis. Among the topics covered are: labor attachment, educational investment, job training, earnings, unemployment, evidence of discrimination, government policies and programs. One could certainly quarrel with the policy conclusions of the authors, since these are clearly dependent on philosophical attitudes. More importantly, their research is thorough, based on careful and proper use of data and a broad knowledge of sources and research in their area.

Current Labor Statistics

Notes on Current Labor Statistics 70

Schedule of release dates for major BLS statistical series 70

Employment data from household survey. Definitions and notes 71
1. Employment status of noninstitutional population, selected years, 1950–79 71
2. Employment status by sex, age, and race, seasonally adjusted 72
3. Selected employment indicators, seasonally adjusted 73
4. Selected unemployment indicators, seasonally adjusted 74
5. Unemployment rates, by sex and age, seasonally adjusted 75
6. Unemployed persons, by reason for unemployment, seasonally adjusted 75
7. Duration of unemployment, seasonally adjusted 75

Employment, hours, and earnings data from establishment surveys. Definitions and notes 76
8. Employment by industry, 1950–79 77
9. Employment by State 77
10. Employment by industry division and major manufacturing group 78
11. Employment by industry division and major manufacturing group, seasonally adjusted 79
12. Labor turnover rates in manufacturing, 1977 to date 80
13. Labor turnover rates in manufacturing, by major industry group 80
14. Hours and earnings, by industry division, 1949–79 81
15. Weekly hours, by industry division and major manufacturing group 82
16. Weekly hours, by industry division and major manufacturing group, seasonally adjusted 83
17. Hourly earnings, by industry division and major manufacturing group 84
18. Hourly Earnings Index, by industry division, seasonally adjusted 84
19. Weekly earnings, by industry division and major manufacturing group 85
20. Gross and spendable weekly earnings, in current and 1967 dollars, 1960 to date 86

Unemployment insurance data. Definitions and notes 87
21. Unemployment insurance and employment service operations 87

Price data. Definitions and notes 88
22. Consumer Price Index, 1967–79 89
23. Consumer Price Index, U.S. city average, general summary and selected items 89
24. Consumer Price Index, cross classification of region and population size class 95
25. Consumer Price Index, selected areas 96
26. Producer Price Indexes, by stage of processing 97
27. Producer Price Indexes, by commodity groupings 98
28. Producer Price Indexes, for special commodity groupings 100
29. Producer Price Indexes, by durability of product 100
30. Producer Price Indexes for the output of selected SIC industries 100

Productivity data. Definitions and notes 103
31. Annual indexes of productivity, hourly compensation, unit costs, and prices, 1950–79 103
32. Annual changes in productivity, hourly compensation, unit costs, and prices, 1969–79 104
33. Quarterly indexes of productivity, hourly compensation, unit costs, and prices, seasonally adjusted 104
34. Percent change from preceding quarter and year in productivity, hourly compensation, unit costs, and prices 105

Labor-management data. Definitions and notes 106
35. Wage and benefit settlements in major collective bargaining units, 1975 to date 106
36. Effective wage rate adjustments going into effect in major collective bargaining units, 1975 to date 107
37. Work stoppages, 1947 to date 107

NOTES ON CURRENT LABOR STATISTICS

This section of the *Review* presents the principal statistical series collected and calculated by the Bureau of Labor Statistics. A brief introduction to each group of tables provides definitions, notes on the data, sources, and other material usually found in footnotes.

Readers who need additional information are invited to consult the BLS regional offices listed on the inside front cover of this issue of the *Review*. Some general notes applicable to several series are given below.

Seasonal adjustment. Certain monthly and quarterly data are adjusted to eliminate the effect of such factors as climatic conditions, industry production schedules, opening and closing of schools, holiday buying periods, and vacation practices, which might otherwise mask short-term movements of the statistical series. Tables containing these data are identified as "seasonally adjusted." Seasonal effects are estimated on the basis of past experience. When new seasonal factors are computed each year, revisions may affect seasonally adjusted data for several preceding years. For a technical discussion of the method used to make seasonal adjustments, see *X-11 Variant of the Census Method II Seasonal Adjustment Program*, Technical Paper No. 15 (Bureau of the Census, 1967).

Seasonally adjusted labor force data in tables 2–7 were last revised in the February 1980 issue of the *Review* to reflect the preceding year's experience. Beginning in January 1980, the BLS introduced two major modifications in the seasonal adjustment methodology for labor force data. First, the data are being seasonally adjusted with a new procedure called X-11/ARIMA, which was developed at Statistics Canada as an extension of the standard X-11 method. A detailed description of the procedure appears in *The X-11 ARIMA Seasonal Adjustment Method* by Estela Bee Dagum (Statistics Canada Catalogue No. 12-564E, September 1979). The second change is that seasonal factors are now being calculated for use during the first 6 months of the year, rather than for the entire year, and then are calculated at mid-year for the July-December period. Revisions of historical data continue to be made only at the end of each calendar year.

Annual revision of the seasonally adjusted payroll data in tables 11, 13, 16, and 18 begins with the August 1980 issue using the X-11 ARIMA seasonal adjustment methodology. New seasonal factors for productivity data in tables 33 and 34 are usually introduced in the September issue. Seasonally adjusted indexes and percent changes from month to month and from quarter to quarter are published for numerous Consumer and Producer Price Index series. However, seasonally adjusted indexes are not published for the U.S. average All Items CPI. Only seasonally adjusted percent changes are available for this series.

Adjustments for price changes. Some data are adjusted to eliminate the effect of changes in price. These adjustments are made by dividing current dollar values by the Consumer Price Index or the appropriate component of the index, then multiplying by 100. For example, given a current hourly wage rate of $3 and a current price index number of 150, where 1967 = 100, the hourly rate expressed in 1967 dollars is $2 ($3/150 × 100 = $2). The resulting values are described as "real," "constant," or "1967" dollars.

Availability of information. Data that supplement the tables in this section are published by the Bureau of Labor Statistics in a variety of sources. Press releases provide the latest statistical information published by the Bureau; the major recurring releases are published according to the schedule given below. The *Handbook of Labor Statistics 1978*, Bulletin 2000, provides more detailed data and greater historical coverage for most of the statistical series presented in the *Monthly Labor Review*. More information from the household and establishment surveys is provided in *Employment and Earnings*, a monthly publication of the Bureau, and in two comprehensive data books issued annually—*Employment and Earnings, United States* and *Employment and Earnings, States and Areas*. More detailed information on wages and other aspects of collective bargaining appears in the monthly periodical, *Current Wage Developments*. More detailed price information is published each month in the periodicals, the *CPI Detailed Report* and *Producer Prices and Price Indexes*.

Symbols

p = preliminary. To improve the timeliness of some series, preliminary figures are issued based on representative but incomplete returns.
r = revised. Generally this revision reflects the availability of later data but may also reflect other adjustments.
n.e.c. = not elsewhere classified.

Schedule of release dates for major BLS statistical series

Title and frequency (monthly except where indicated)	Release date	Period covered	Release date	Period covered	MLR table number
Employment situation	September 5	August	October 3	September	1-11
Producer Price Index	September 5	August	October 3	September	26-30
Consumer Price Index	September 23	August	October 24	September	22-25
Real earnings	September 23	August	October 24	September	14-20
Work stoppages	September 29	August	October 28	September	37
Labor turnover in manufacturing	September 30	August	October 30	September	12-13
Productivity and costs (quarterly):					
Nonfarm business and manufacturing	....	....	October 27	3rd quarter	31-34
Major collective bargaining settlements (quarterly)	....	....	October 27	1st 9 months	35-36

EMPLOYMENT DATA FROM THE HOUSEHOLD SURVEY

EMPLOYMENT DATA in this section are obtained from the Current Population Survey, a program of personal interviews conducted monthly by the Bureau of the Census for the Bureau of Labor Statistics. The sample consists of about 65,000 households beginning in January 1980, selected to represent the U.S. population 16 years of age and older. Households are interviewed on a rotating basis, so that three-fourths of the sample is the same for any 2 consecutive months.

Definitions

Employed persons are (1) those who worked for pay any time during the week which includes the 12th day of the month or who worked unpaid for 15 hours or more in a family-operated enterprise and (2) those who were temporarily absent from their regular jobs because of illness, vacation, industrial dispute, or similar reasons. A person working at more than one job is counted only in the job at which he or she worked the greatest number of hours.

Unemployed persons are those who did not work during the survey week, but were available for work except for temporary illness and had looked for jobs within the preceding 4 weeks. Persons who did not look for work because they were on layoff or waiting to start new jobs within the next 30 days are also counted among the unemployed. The **unemployment rate** represents the number unemployed as a percent of the civilian labor force.

The **civilian labor force** consists of all employed or unemployed persons in the civilian noninstitutional population; the **total labor force** includes military personnel. Persons **not in the labor force** are those not classified as employed or unemployed; this group includes persons retired, those engaged in their own housework, those not working while attending school, those unable to work because of longterm illness, those discouraged from seeking work because of personal or job market factors, and those who are voluntarily idle. The **noninstitutional population** comprises all persons 16 years of age and older who are not inmates of penal or mental institutions, sanitariums, or homes for the aged, infirm, or needy.

Full-time workers are those employed at least 35 hours a week; **part-time workers** are those who work fewer hours. Workers on part-time schedules for economic reasons (such as slack work, terminating or starting a job during the week, material shortages, or inability to find full-time work) are among those counted as being on full-time status, under the assumption that they would be working full time if conditions permitted. The survey classifies unemployed persons in full-time or part-time status by their reported preferences for full-time or part-time work.

Notes on the data

From time to time, and especially after a decennial census, adjustments are made in the Current Population Survey figures to correct for estimating errors during the preceding years. These adjustments affect the comparability of historical data presented in table 1. A description of these adjustments and their effect on the various data series appear in the Explanatory Notes of *Employment and Earnings.*

Data in tables 2–7 are seasonally adjusted, based on the seasonal experience through December 1979.

1. Employment status of the noninstitutional population, 16 years and over, selected years, 1950–79

[Numbers in thousands]

Year	Total noninstitutional population	Total labor force		Civilian labor force						Not in labor force

EMPLOYMENT, HOURS, AND EARNINGS DATA FROM ESTABLISHMENT SURVEYS

EMPLOYMENT, HOURS, AND EARNINGS DATA in this section are compiled from payroll records reported monthly on a voluntary basis to the Bureau of Labor Statistics and its cooperating State agencies by 166,000 establishments representing all industries except agriculture. In most industries, the sampling probabilities are based on the size of the establishment; most large establishments are therefore in the sample. (An establishment is not necessarily a firm; it may be a branch plant, for example, or warehouse.) Self-employed persons and others not on a regular civilian payroll are outside the scope of the survey because they are excluded from establishment records. This largely accounts for the difference in employment figures between the household and establishment surveys.

LABOR TURNOVER DATA in this section are compiled from personnel records reported monthly on a voluntary basis to the Bureau of Labor Statistics and its cooperating State agencies. A sample of 40,000 establishments represents all industries in the manufacturing and mining sectors of the economy.

Definitions

Employed persons are all persons who received pay (including holiday and sick pay) for any part of the payroll period including the 12th of the month. Persons holding more than one job (about 5 percent of all persons in the labor force) are counted in each establishment which reports them.

Production workers in manufacturing include blue-collar worker supervisors and all nonsupervisory workers closely associated with production operations. Those workers mentioned in tables 14–20 include production workers in manufacturing and mining; construction workers in construction; and nonsupervisory workers in transportation and public utilities, in wholesale and retail trade, in finance, insurance, and real estate, and in services industries. These groups account for about four-fifths of the total employment on private nonagricultural payrolls.

Earnings are the payments production or nonsupervisory workers receive during the survey period, including premium pay for overtime or late-shift work but excluding irregular bonuses and other special payments. **Real earnings** are earnings adjusted to eliminate the effects of price change. The **Hourly Earnings Index** is calculated from average hourly earnings data adjusted to exclude the effects of two types of changes that are unrelated to underlying wage-rate developments: fluctuations in overtime premiums in manufacturing (the only sector for which overtime data are available) and the effects of changes and seasonal factors in the proportion of workers in high-wage and low-wage industries. **Spendable earnings** are earnings from which estimated social security and Federal income taxes have been deducted. The Bureau of Labor Statistics computes spendable earnings from gross weekly earnings for only two illustrative cases: (1) a worker with no dependents and (2) a married worker with three dependents.

Hours represent the average weekly hours of production or nonsupervisory workers for which pay was received and are different from standard or scheduled hours. **Overtime hours** represent the portion of gross average weekly hours which were in excess of regular hours and for which overtime premiums were paid.

Labor turnover is the movement of all wage and salary workers from one employment status to another. **Accession rates** indicate the average number of persons added to a payroll in a given period per 100 employees; **separation rates** indicate the average number dropped from a payroll per 100 employees. Although month-to-month changes in employment can be calculated from the labor turnover data, the results are not comparable with employment data from the employment and payroll survey. The labor turnover survey measures changes during the calendar month while the employment and payroll survey measures changes from midmonth to midmonth.

Notes on the data

Establishment data collected by the Bureau of Labor Statistics are periodically adjusted to comprehensive counts of employment (called "benchmarks"). The latest complete adjustment was made with the release of June 1980 data, published in the August 1980 issue of the *Review*. Consequently, data published in the *Review* prior to that issue are not necessarily comparable to current data. Complete comparable historical unadjusted and seasonally adjusted data are published in a Supplement to Employment and Earnings (unadjusted data from April 1977 through March 1980 and seasonally adjusted data from January 1974 through March 1980) and in *Employment and Earnings, United States, 1909–78*, BLS Bulletin 1312–11 (for prior periods).

Data on recalls were shown for the first time in tables 12 and 13 in the January 1978 issue of the *Review*. For a detailed discussion of the recalls series, along with historical data, see "New Series on Recalls from the Labor Turnover Survey," *Employment and Earnings*, December 1977, pp. 10–19.

A comprehensive discussion of the differences between household and establishment data on employment appears in Gloria P. Green, "Comparing employment estimates from household and payroll surveys," *Monthly Labor Review*, December 1969, pp. 9–20. See also *BLS Handbook of Methods for Surveys and Studies*, Bulletin 1910 (Bureau of Labor Statistics, 1976).

The formulas used to construct the spendable average weekly earnings series reflect the latest provisions of the Federal income tax and social security tax laws. For the spendable average weekly earnings formulas for the years 1978–80, see *Employment and Earnings*, March 1980, pp. 10–11. Real earnings data are adjusted using the Consumer Price Index for Urban Wage Earners and Clerical Workers (CPI-W).

NOTE: The earnings expressed in 1967 dollars have been adjusted for changes in price level as measured by the Bureau's Consumer Price Index for Urban Wage Earners and Clerical Workers. These series are described in "The Spendable Earnings Series: A Technical Note on its Calculation," **Employment and Earnings and Monthly Report on the Labor Force**, February 1969, pp. 6–13. See also "Spendable Earnings Formulas, 1978–80," **Employment and Earnings**, March 1980, pp. 10–11.

UNEMPLOYMENT INSURANCE DATA

UNEMPLOYMENT INSURANCE DATA are compiled monthly by the Employment and Training Administration of the U.S. Department of Labor from records of State and Federal unemployment insurance claims filed and benefits paid. Railroad unemployment insurance data are prepared by the U.S. Railroad Retirement Board.

Definitions

Data for **all programs** represent an unduplicated count of insured unemployment under State programs, Unemployment Compensation for Ex-Servicemen, and Unemployment Compensation for Federal Employees, and the Railroad Insurance Act.

Under both State and Federal unemployment insurance programs for civilian employees, insured workers must report the completion of at least 1 week of unemployment before they are defined as unemployed. Persons not covered by unemployment insurance (about one-third of the labor force) and those who have exhausted or not yet earned benefit rights are excluded from the scope of the survey. **Initial claims** are notices filed by persons in unemployment insurance programs to indicate they are out of work and wish to begin receiving compensation. A claimant who continued to be unemployed a full week is then counted in the insured unemployment figure. The **rate of insured unemployment** expresses the number of insured unemployed as a percent of the average insured employment in a 12-month period.

An **application** for benefits is filed by a railroad worker at the beginning of his first period of unemployment in a benefit year; no application is required for subsequent periods in the same year. **Number of payments** are payments made in 14-day registration periods. The **average amount of benefit payment** is an average for all compensable periods, not adjusted for recovery of overpayments or settlement of underpayments. However, **total benefits** paid have been adjusted.

21. Unemployment insurance and employment service operations

[All items except average benefits amounts are in thousands]

[1] Initial claims and State insured unemployment include data under the program for Puerto Rican sugarcane workers.

[2] Includes interstate claims for the Virgin Islands. Excludes transition claims under State programs.

[3] Excludes data on claims and payments made jointly with other programs.

[4] Includes the Virgin Islands. Excludes data on claims and payments made jointly with State programs.

[5] Cumulative total for fiscal year (October 1 - September 30).

NOTE: Data for Puerto Rico included. Dashes indicate data not available.

r = revised.

PRICE DATA

PRICE DATA are gathered by the Bureau of Labor Statistics from retail and primary markets in the United States. Price indexes are given in relation to a base period (1967 = 100, unless otherwise noted).

Definitions

The **Consumer Price Index** is a monthly statistical measure of the average change in prices in a fixed market basket of goods and services. Effective with the January 1978 index, the Bureau of Labor Statistics began publishing CPI's for two groups of the population. One index, a new CPI for All Urban Consumers, covers 80 percent of the total noninstitutional population; and the other index, a revised CPI for Urban Wage Earners and Clerical Workers, covers about half the new index population. The All Urban Consumers index includes, in addition to wage earners and clerical workers, professional, managerial, and technical workers, the self-employed, short-term workers, the unemployed, retirees, and others not in the labor force.

The CPI is based on prices of food, clothing, shelter, fuel, drugs, transportation fares, doctor's and dentist's fees, and other goods and services that people buy for day-to-day living. The quantity and quality of these items is kept essentially unchanged between major revisions so that only price changes will be measured. Prices are collected from over 18,000 tenants, 24,000 retail establishments, and 18,000 housing units for property taxes in 85 urban areas across the country. All taxes directly associated with the purchase and use of items are included in the index. Because the CPI's are based on the expenditures of two population groups in 1972–73, they may not accurately reflect the experience of individual families and single persons with different buying habits.

Though the CPI is often called the "Cost-of-Living Index," it measures only price change, which is just one of several important factors affecting living costs. Area indexes do not measure differences in the level of prices among cities. They only measure the average change in prices for each area since the base period.

Producer Price Indexes measure average changes in prices received in primary markets of the United States by producers of commodities in all stages of processing. The sample used for calculating these indexes contains about 2,800 commodities and about 10,000 quotations per month selected to represent the movement of prices of all commodities produced in the manufacturing, agriculture, forestry, fishing, mining, gas and electricity, and public utilities sectors. The universe includes all commodities produced or imported for sale in commercial transactions in primary markets in the United States.

Producer Price Indexes can be organized by stage of processing or by commodity. The stage of processing structure organizes products by degree of fabrication (that is, finished goods, intermediate or semifinished goods, and crude materials). The commodity structure organizes products by similarity of end-use or material composition.

To the extent possible, prices used in calculating Producer Price Indexes apply to the first significant commercial transaction in the United States, from the production or central marketing point. Price data are generally collected monthly, primarily by mail questionnaire. Most prices are obtained directly from producing companies on a voluntary and confidential basis. Prices generally are reported for the Tuesday of the week containing the 13th day of the month.

In calculating Producer Price Indexes, price changes for the various commodities are averaged together with implicit quantity weights representing their importance in the total net selling value of all commodities as of 1972. The detailed data are aggregated to obtain indexes for stage of processing groupings, commodity groupings, durability of product groupings, and a number of special composite groupings.

Price indexes for the output of selected SIC industries measure average price changes in commodities produced by particular industries, as defined in the *Standard Industrial Classification Manual 1972* (Washington, U.S. Office of Management and Budget, 1972). These indexes are derived from several price series, combined to match the economic activity of the specified industry and weighted by the value of shipments in the industry. They use data from comprehensive industrial censuses conducted by the U.S. Bureau of the Census and the U.S. Department of Agriculture.

Notes on the data

Beginning with the May 1978 issue of the *Review*, regional CPI's cross classified by population size, were introduced. These indexes will enable users in local areas for which an index is not published to get a better approximation of the CPI for their area by using the appropriate population size class measure for their region. The cross-classified indexes will be published bimonthly. (See table 24.)

For further details about the new and the revised indexes and a comparison of various aspects of these indexes with the old unrevised CPI, see *Facts About the Revised Consumer Price Index*, a pamphlet in the Consumer Price Index Revision 1978 series. See also *The Consumer Price Index: Concepts and Content Over the Years*. Report 517, revised edition (Bureau of Labor Statistics, May 1978).

For interarea comparisons of living costs at three hypothetical standards of living, see the family budget data published in the *Handbook of Labor Statistics, 1977*, Bulletin 1966 (Bureau of Labor Statistics, 1977), tables 122–133. Additional data and analysis on price changes are provided in the *CPI Detailed Report* and *Producer Prices and Price Indexes*, both monthly publications of the Bureau.

As of January 1976, the Wholesale Price Index (as it was then called) incorporated a revised weighting structure reflecting 1972 values of shipments. From January 1967 through December 1975, 1963 values of shipments were used as weights.

For a discussion of the general method of computing consumer, producer, and industry price indexes, see *BLS Handbook of Methods for Surveys and Studies*, Bulletin 1910 (Bureau of Labor Statistics, 1976), chapters 13–15. See also John F. Early, "Improving the measurement of producer price change," *Monthly Labor Review*, April 1978, pp. 7–15. For industry prices, see also Bennett R. Moss, "Industry and Sector Price Indexes," *Monthly Labor Review*, August 1965, pp. 974–82.

[1] Data for March 1980 have been revised to reflect the availability of late reports and corrections by respondents. All data are subject to revision 4 months after original publication.

[2] Prices for natural gas are lagged 1 month.

[3] Includes only domestic production.

[4] Most prices for refined petroleum products are lagged 1 month.

[5] Some prices for industrial chemicals are lagged 1 month.

28. Producer Price Indexes, for special commodity groupings

[1967 = 100 unless otherwise specified]

Commodity grouping	Annual average 1979	1979						1980						
		July	Aug.	Sept.	Oct.	Nov.	Dec.	Jan.	Feb.	Mar.[1]	Apr.	May	June	July

[1] Data for March 1980 have been revised to reflect the availability of late reports and corrections by respondents. All data are subject to revision 4 months after original publication.

c = corrected.

PRODUCTIVITY DATA

PRODUCTIVITY DATA are compiled by the Bureau of Labor Statistics from establishment data and from estimates of compensation and output supplied by the U.S. Department of Commerce and the Federal Reserve Board.

Definitions

Output is the constant dollar gross domestic product produced in a given period. Indexes of **output per hour of labor input,** or labor productivity, measure the value of goods and services produced per hour of labor. **Compensation per hour** includes wages and salaries of employees plus employers' contributions for social insurance and private benefit plans. The data also include an estimate of wages, salaries, and supplementary payments for the self-employed, except for nonfinancial corporations, in which there are no self-employed. **Real compensation per hour** is compensation per hour adjusted by the Consumer Price Index for All Urban Consumers.

Unit labor cost measures the labor compensation cost required to produce one unit of output and is derived by dividing compensation by output. **Unit nonlabor payments** include profits, depreciation, interest, and indirect taxes per unit of output. They are computed by subtracting compensation of all persons from the current dollar gross domestic product and dividing by output. In these tables, **Unit nonlabor costs** contain all the components of unit nonlabor payments except unit profits. **Unit profits** include corporate profits and inventory valuation adjustments per unit of output.

The **implicit price deflator** is derived by dividing the current dollar estimate of gross product by the constant dollar estimate, making the deflator, in effect, a price index for gross product of the sector reported.

The use of the term "man-hours" to identify the labor component of productivity and costs, in tables 31 through 34, has been discontinued. **Hours of all persons** is now used to describe the labor input of payroll workers, self-employed persons, and unpaid family workers. **Output per all-employee hour** is now used to describe labor productivity in nonfinancial corporations where there are no self-employed.

Notes on the data

In the private business sector and the nonfarm business sector, the basis for the output measure employed in the computation of output per hour is Gross Domestic Product rather than Gross National Product. Computation of hours includes estimates of nonfarm and farm proprietor hours.

Output data are supplied by the Bureau of Economic Analysis, U.S. Department of Commerce, and the Federal Reserve Board. Quarterly manufacturing output indexes are adjusted by the Bureau of Labor Statistics to annual estimates of output (gross product originating) from the Bureau of Economic Analysis. Compensation and hours data are from the Bureau of Economic Analysis and the Bureau of Labor Statistics.

Beginning with the September 1976 issue of the *Review*, tables 31–34 were revised to reflect changeover to the new series—private business sector and nonfarm business sector—which differ from the previously published total private economy and nonfarm sector in that output imputed for owner-occupied dwellings and the household and institutions sectors, as well as the statistical discrepancy, are omitted. For a detailed explanation, see J. R. Norsworthy and L. J. Fulco, "New sector definitions for productivity series," *Monthly Labor Review*, October 1976, pages 40–42.

LABOR-MANAGEMENT DATA

MAJOR COLLECTIVE BARGAINING DATA are obtained from contracts on file at the Bureau of Labor Statistics, direct contact with the parties, and from secondary sources. Additional detail is published in *Current Wage Developments*, a monthly periodical of the Bureau. Data on work stoppages are based on confidential responses to questionnaires mailed by the Bureau of Labor Statistics to parties involved in work stoppages. Stoppages initially come to the attention of the Bureau from reports of Federal and State mediation agencies, newspapers, and union and industry publications.

Definitions

Data on wage changes apply to private nonfarm industry agreements covering 1,000 workers or more. Data on wage and benefit changes *combined* apply only to those agreements covering 5,000 workers or more. **First-year wage settlements** refer to pay changes going into effect within the first 12 months after the effective date of the agreement. **Changes over the life of the agreement** refer to total agreed upon settlements (exclusive of potential cost-of-living escalator adjustments) expressed at an average annual rate. **Wage-rate changes** are expressed as a percent of straight-time hourly earnings, while **wage and benefit changes** are expressed as a percent of total compensation.

Effective wage-rate adjustments going into effect in major bargaining units measure changes actually placed into effect during the reference period, whether the result of a newly negotiated increase, a deferred increase negotiated in an earlier year, or as a result of a cost-of-living escalator adjustment. Average adjustments are affected by workers receiving no adjustment, as well as by those receiving increases or decreases.

Work stoppages include all known strikes or lockouts involving six workers or more and lasting a full shift or longer. Data cover all workers idle one shift or more in establishments directly involved in a stoppage. They do not measure the indirect or secondary effect on other establishments whose employees are idle owing to material or service shortages.

35. Wage and benefit settlements in major collective bargaining units, 1975 to date
[In percent]

Sector and measure	Annual average					Quarterly average							
	1975	1976	1977	1978	1979	1978		1979				1980 p

☆U.S. GOVERNMENT PRINTING OFFICE: 1980 O— 311-406/45

How to order BLS publications

PERIODICALS

Order from (and make checks payable to) Superintendent of Documents, Washington, D.C. 20402. For foreign subscriptions, add 25 percent.

Monthly Labor Review. The oldest and most authoritative government research journal in economics and the social sciences. Current statistics, analysis, developments in industrial relations, court decisions, book reviews. $18 a year, single copy, $2.50.

Employment and Earnings. A comprehensive monthly report on employment, hours, earnings, and labor turnover by industry, area, occupation, et cetera $22 a year, single copy $2.75.

Occupational Outlook Quarterly. A popular periodical designed to help high school students and guidance counselors assess career opportunities. $6 for four issues, single copy $1.75.

Current Wage Developments. A monthly report about collective bargaining settlements and unilateral management decisions about wages and benefits; statistical summaries. $12 a year, single copy $1.35.

Producer Prices and Price Indexes. A comprehensive monthly report on price movements of both farm and industrial commodities, by industry and stage of processing. $17 a year, single copy $2.25.

CPI Detailed Report. A monthly periodical featuring detailed data and charts on the Consumer Price Index. $15 a year, single copy $2.25.

PRESS RELEASES

The Bureau's statistical series are made available to news media through press releases issued in Washington. Many of the releases also are available to the public upon request. Write: Bureau of Labor Statistics, Washington, D.C. 20212.

Regional. Each of the Bureau's eight regional offices publishes reports and press releases dealing with regional data. Single copies available free from the issuing regional office.

BULLETINS AND HANDBOOKS

About 140 bulletins and handbooks published each year are for sale by regional offices of the Bureau of Labor Statistics (see inside front cover) and by the Superintendent of Documents. Washington, D.C. 20402. Make checks payable to the Superintendent of Documents. Among the bulletins and handbooks currently in print are these:

Occupational Outlook Handbook, 1980–81 Edition. Bulletin 2075. A useful resource supplying valuable assistance to all persons seeking satisfying and productive employment. $8, paperback; $11 cloth cover.

BLS Handbook of Labor Statistics 1978. Bulletin 2000. A 604-page volume of historical data on the major BLS statistical series. $9.50.

Handbook of Methods. Bulletin 1910. Brief technical account of each major statistical program of the Bureau of Labor Statistics. $3.50.

BLS Measures of Compensation. Bulletin 1941. An introduction to the various measures of employee compensation; describes each series, the manner in which it is developed, its uses and limitations. $2.75.

Occupational Projections and Training Data. Bulletin 2020. Presents both general and detailed information on the relationship between occupational requirements and training needs. (Updates Bulletin 1918 published in 1976.) $3.25.

Technological Change and its Labor Impact in Five Energy Industries. Bulletin 2005. A 64-page study appraising major technological change and discussing the impact of these changes on productivity and occupations over the next 5 to 10 years. $2.40.

BLS Publications, 1972–77. Bulletin 1990. A numerical listing and subject index of bulletins and reports issued by the Bureau from 1972 through 1977, supplementing Bulletin 1749, covering 1886–1971. $1.80.

International Comparisons of Unemployment. Bulletin 1979. Brings together all of the Bureau's work on international unemployment comparisons. Describes the methods of adjusting foreign unemployment rates in 8 countries to U.S. concepts. $3.50.

Productivity Indexes for Selected Industries, 1979 Edition. Bulletin 2054. A 190-page report of indexes of output, employment, and employee hours in selected industries from 1954 to 1978. This edition contains measures for three industries previously not covered, as well as components of previously published measures in 10 industries. $5.50.

Profiles of Occupational Pay: A Chartbook. Bulletin 2037. A graphic illustration of some of the factors that affect workers' earnings. This three-part presentation looks at wage variations among and within occupations and portrays characteristics of high- and low-paying urban areas and manufacturing industries. $3.50.

REPORTS AND PAMPHLETS

Single copies available free from the BLS regional offices or from the Bureau of Labor Statistics, U.S. Department of Labor, Washington, D.C. 20212.

How the Government Measures Unemployment. Report 505. A concise report providing a background for appraising developments in the area of unemployment.

Directory of BLS Studies in Industrial Relations 1960–78. Report 550. A listing of studies prepared by the Division of Industrial Relations as part of the Bureau's regular program of data collection and analysis in the field of industrial relations.

IMMIGRATION AND THE LABOR FORCE

Philip L. Martin, Alan Richards 4 **International migration of labor: boon or bane?**
According to trade theory, free labor flows across national borders should benefit workers, employers, and societies; but recent evidence raises doubts about the results

Ayse Kudat, Mine Sabuncuoglu 10 **The changing composition of Europe's guestworker population**
Although the flow of guestworkers diminished during the 1970's, wives joined those who remained; the proportion of women migrants rose and now exceeds 40 percent

Ellen Sehgal, Joyce Vialet 18 **Documenting the undocumented: data, like aliens, are elusive**
Millions of illegal immigrants currently live and work in the United States, but efforts to estimate their economic and societal impact are hampered by lack of valid information

Barry R. Chiswick 22 **Immigrant earnings patterns by sex, race, and ethnic groupings**
Based on 1970 census data, most immigrant men reach earnings equality with natives in 11 to 15 years; for women, earnings vary more by racial and ethnic characteristics

David S. North 26 **Nonimmigrant workers: visiting labor force participants**
These aliens include students, laborers, and professionals; most require sponsors and to obtain temporary workers employers must show that U.S. workers are unavailable

Robert L. Bach, Jennifer B. Bach 31 **Employment patterns of Southeast Asian refugees**
Based on the limited data available, most earlier Indochinese refugees found work, but recent arrivals speak less English and are confronted with a weaker job market

Robert L. Bach 39 **The new Cuban immigrants: their background and prospects**
Most early arrivals were young working-age men, with education and skill levels above average for Cuba; ex-offenders include many jailed for political reasons

David S. North, Philip L. Martin 47 **Immigration and employment: a need for policy coordination**
Immigrants may constitute up to 45 percent of future U.S. labor force growth; efforts are needed to ensure that immigration, employment goals are complementary

Labor Month In Review

IMPROVING JOBLESS PAY. The National Commission on Unemployment Compensation, a 13-member panel representing employers, employees, and the public, completed a 4-year study with more than 30 recommendations to improve or preserve the unemployment compensation system. Highlights:

Broader coverage. The commission calls for a major expansion of coverage. Several proposals would be especially beneficial to women: the panel asks that "sexual harassment" and "compelling family circumstances" be considered legitimate reasons for leaving a job and that persons who seek only part-time work be eligible for compensation. In addition, displaced homemakers who registered for work would qualify for benefits through unemployment insurance credits or equivalent work or on the basis of credits earned by their spouses. Other groups included in the broadened coverage are all agricultural workers (presently only those on farms with 10 or more employees or a $20,000 payroll are insured) and household workers who are paid at least $50 a quarter (presently only those receiving $1,000 or more are covered).

Tax-exempt payments. The panel recommends that unemployment insurance payments be exempted from Federal income tax, calling the practice discriminatory (because some other incomes are not taxed) and citing the difficulties of the Internal Revenue Service in enforcing this provision. It recommends that basic benefits be increased, in steps, to a maximum in 1986 of two-thirds of a State's average weekly wage for covered workers.

The Commission wants greater protection provided during periods of heavy unemployment and recommends a "State extended benefit" (SEB) program that would provide, depending on a State's insured unemployment rate, up to an additional 26 weeks of unemployment benefits. This means that some workers could receive 65 weeks of aid; the present maximum benefit period is 39 weeks. For the longer-term unemployed, the Commission proposes increasing Comprehensive Employment and Training Administration (CETA) job slots and recommends establishing some type of income-tested program, separate from the unemployment compensation program, for all unemployed persons, including those who have exhausted their benefits under the present program.

Finances and administration. The Commission, concerned about recent increases of unemployment which have threatened the integrity of the system, makes several recommendations for putting unemployment compensation programs on sound financial footing. It proposes gradually increasing the taxable wage base from 50 percent of the average earnings of covered employees in 1983 to 65 percent in 1989 and also favors reducing employer payroll taxes for past debts. To encourage prudent financial policies, the Commission suggests allowing only financially solvent States to borrow from Federal funds. The panel also wants to establish a Board of Trustees to monitor unemployment insurance trust funds. Several of the board's major responsibilities would be to set investment policies and inform the Congress on amounts needed to finance a State's compensation fund.

The panel suggests the system would be more efficient if the U.S. Treasury Department would let the States collect unemployment payroll taxes. It also wants more Federal funds allocated for detecting fraud, errors, and tax delinquencies and believes that the U.S. Employment Service should be expanded, from its present ceiling of 30,000 employees to 50,000 by 1985.

First major review. The Federal-State unemployment system was established in 1935. Although many changes have been made at both the Federal and State levels, this study marks the first time a comprehensive review of the system has been made. Congress established the National Commission on Unemployment Compensation in 1976 to examine the unemployment programs of States and make recommendations for improvement. The Commission expired September 30, but it asks the Congress to appoint a similar National Commission every 10 years, beginning in 1988.

Wilbur J. Cohen, head of the panel, estimated that adoption of all the recommendations would increase the cost of the unemployment compensation program by $10 billion, to $35 billion. But, he warned that "uncompensated unemployment can cost society much more than the cost of a reasonably improved unemployment compensation system."

The preliminary report, *Unemployment Compensation Policy Decisions,* is available from the National Commission on Unemployment Compensation, 1815 Lynn Street, Arlington, Va. 22209. ☐

Immigration and the labor force

Although the United States has been, from its beginning, a nation of immigrants—more are admitted each year than to any other nation in the world—U.S. immigration policy has wavered between welcoming immigrants and excluding them. When workers and their skills were needed, immigrants usually have been welcomed, even actively sought. During hard times, when job competition was keenest, efforts at exclusion have been frequent.

Recent discussion of immigration to the United States has focused on illegal immigrants, their impact on the U.S. economy, and on refugees from Southeast Asia and Cuba. This special issue of the Monthly Labor Review reports on these groups, but also examines broader immigration questions.

In the opening articles, Philip L. Martin and Alan Richards help us view U.S. immigration in the context of international migration, while Ayse Kudat and Mine Sabuncuoglu examine Europe's guestworker experience. The problems of counting and evaluating the impact of Mexican and other illegal aliens are explored by Ellen Sehgal and Joyce Vialet. Barry R. Chiswick analyzes the earnings patterns of immigrants, while David S. North examines the special problems of aliens who are temporary workers. The employment patterns and prospects of recent immigrants from Southeast Asia and Cuba are the subjects of articles by Robert L. and Jennifer B. Bach. In the final article, David S. North and Philip L. Martin examine differences between immigration and employment policies and point to the need for more coordination.

Although the articles deal with many facets of immigration and represent differing approaches, not all aspects or views of immigration are covered. Readers who wish to comment on the articles or present additional information are invited to do so.

The editors thank the authors who contributed to this special issue of the Review and express particular appreciation to Ellen Sehgal, who served as overall consultant for the issue, and to Gregory J. Mounts and Mary K. Rieg, who provided special editorial assistance.

International migration of labor: boon or bane?

According to trade theory,
free labor flows across national borders
should benefit workers, employers, and societies;
but recent evidence indicates that such migrations
may not provide these desired benefits

PHILIP L. MARTIN AND ALAN RICHARDS

An estimated 20 million persons currently live and work in countries where they are neither citizens nor intend to be permanent immigrants. One-half of these are legally admitted "guestworkers"; the rest are illegal aliens or "undocumented workers."[1] This article surveys contemporary labor migrations, assesses their impacts on the areas which send and receive them, and explores future trends in international labor flows.[2]

Historically, migration brought permanent settlers from the cosmopolitan East to the frontier West. Between 1800 and 1930, for example, 60 to 70 million foreigners arrived in the Americas, including indentured servants and slaves. Some eventually returned to their countries of origin,[3] but most brought with them their mobile assets, intending a permanent break with their homelands.

Contemporary migration, on the other hand, is largely a flow of workers, rather than of permanent settlers. Most of today's migrants move from less to more developed nations. They tend to be drawn from the middle economic ranks of the societies which send them; the very poor are generally unable to finance the trip or obtain a work permit.[4]

Much migration is temporary today because few areas remain open for permanent immigrants. Better communication, lower real transport costs, and the creation of new borders should promote *more* international resettlement. Instead, most estimates put the number of legally admitted immigrants (excluding refugees) to all countries at no more than 1 million annually, of which the United States receives 40 to 50 percent. While the impulse to migrate may be as strong as ever, aspiring permanent settlers find few opportunities to do so.[5]

Migrant labor benefits a variety of people in sending and receiving areas. Labor migration provides income for individual aliens and remittances, through workers' dependents, to sending nations. Employers hiring aliens benefit, as do domestic consumers, when lower labor costs translate into lower prices for goods and services. Some native workers may also gain if the presence of foreign labor preserves or creates skilled or supervisory jobs for them. Finally, governments in labor-importing countries may enjoy increased net income if more is collected from legal aliens in taxes than it costs to provide them public services.

The original premise motivating labor transfers held that such migration was a positive-sum exchange: except for a few natives who might have to compete for jobs with the aliens, everyone gained. It is true that benefits do flow from the use of foreign labor—benefits sufficient to make halting labor migration very difficult. But labor transfer often leads to undesired results, mainly unemployment and low wages for some host-nation residents and employer addiction to low-cost labor. Much of the following discussion focuses on what goes wrong in labor migrations, but it is important to note

---

Philip L. Martin is an associate professor of agricultural economics at the University of California at Davis. Alan Richards is an assistant professor of economics at the University of California at Santa Cruz.

that economic advantages also accrue from the use of alien labor.

Contemporary labor flows

The magnitude and diversity of present day labor flows is unprecedented. They may reflect traditional movements to and from new nation states, illegal migration on a new scale, or publicly and privately organized labor transfers. Among the most controversial of these flows are those of illegal aliens to the United States, "guestworkers" to Western Europe, large foreign workforces to the Middle East, and black labor to South Africa.

Guestworkers. Legal "guestworkers" are foreign nationals admitted to a country for a fixed period to work for a particular employer.[6] Thus, they are "guests" in the economic system, rather than aspiring permanent residents. Most official guestworker programs are jointly directed by labor ministries and immigration authorities so that immigration can be regulated in accordance with current labor market needs.

Because guestworkers are admitted for predetermined periods of employment, they leave families and assets behind. After achieving a savings target or fulfilling a 1- or 2-year contract, they are expected to return home and perhaps be replaced by other workers eager for a chance to earn "high wages." Thus, implementation of a guestworker program reflects the belief by the host nation that a particular domestic labor shortage is only temporary. As we will see, such beliefs are often unrealistic.

The most noteworthy guestworker programs were initiated by Western European nations between 1960 and 1973.[7] France and Germany absorbed more than two-thirds of Europe's migrant workers, although alien labor dependency reached its zenith during the late 1960's in Switzerland, where 1 in 3 workers was foreign. In most instances, international agreements regulated the recruitment and transportation of guestworkers, while both domestic and bilateral considerations governed migrant rights in receiving societies and the ultimate fate of migrant populations. During the 6 years following the European "recruitment stop," nations which formerly imported labor have been plagued by unanticipated results of their guestworker programs. These problems include foreign resident populations swelled by family unification; persistent labor shortages in the "secondary" (low-wage, low-skill) job markets in which alien labor is concentrated; and the treatment of migrant children, who are expected to leave, but are likely to become permanent residents.

Migrants in the United States. The U.S. labor system most closely resembling a legal guestworker program is that which supplies farmworkers for temporary harvest employment. This reliance on imported farmworkers is anachronistic; most industrialized nations do not structure agriculture in a way which requires migrant labor. And, whether inherently flawed or only badly administered to date, temporary farmworker programs are generally regarded as one of the sorriest chapters in American labor history.

The United States is also the world's largest *de facto* employer of foreign labor. A variety of past and current factors, including the Bracero program (1942–1964), lax enforcement of U.S. borders and immigration laws, and Third World perceptions of U.S. economic opportunities, have produced an illegal labor force 4 to 6 million strong. Apprehensions of such workers by the Immigration and Naturalization Service have been mounting steadily for over a decade, and now exceed 1 million persons annually. Many observers believe that current resident aliens must eventually be granted amnesty permitting them to stay in the United States. Other possible solutions to the problem of illegal immigration are currently under study by a Congressional Select Commission.

Finally, the United States admits more of the world's stock of 14 million refugees than any other nation. The 1952 immigration law expedited the entry of aliens fleeing Communist and Middle Eastern lands but discouraged granting asylum to those from other countries. Since 1975, the United States has admitted more than 750,000 refugees. The economic and social pressure of these numbers led to passage of the Refugee Act of 1980,[8] which sought to streamline admission procedures by adopting the United Nations' definition of "refugee"[9] and setting an annual limit of 50,000 refugees for the United States. The challenge now facing this nation and other industrial societies is how to distinguish between economic and political refugees, particularly when some authoritarian governments blur such distinctions.

Other labor flows. Oil-rich Middle Eastern countries are the temporary homes of 2 to 3 million workers. Aliens often constitute well over half of a Middle Eastern labor importer's workforce. Labor flows in this region are characterized by a relatively high proportion of managerial or highly skilled persons from more industrialized nations. Even so, most of the Middle East's alien workers, like guestworkers everywhere, are unskilled or semi-skilled.

Private contractors in the Middle East are expected to supply and control their own workforces. Some guestworkers are also hired directly by governmental agencies, but the absence of general labor laws and formal labor transfer agreements produces employment conditions which vary widely within and between countries.[10]

The other major labor flows are still more varied. Several million agricultural guestworkers move between African nations each year. In South America, the economic attractions of Venezuela and Argentina make them the primary destinations, although South America's migrations often include political refugees as well as persons seeking employment. And, East Germany is a temporary home to an estimated 100,000 workers from other Eastern Bloc nations. A variety of less visible illegal flows, and legal but only seasonal labor transfers complete this sketch of current international labor migration.[11]

During the 1970's, many countries attempted to reduce their legal alien workforces by encouraging workers to return to their homes, or by permitting them to become permanent immigrants. However, indications are that over the same period, the number of illegal migrants has increased dramatically.

Theory and reality

According to international trade theory, two nations with unequal resource endowments or productivities can enjoy a bilateral increase in economic well-being by freely exchanging capital, goods, and labor. Economic benefits arise from the fact that one nation can use the other's capital or labor more productively, or that one nation has a comparative advantage over its trading partner in the production of certain goods. Permitting trade and migration thus increases the output available to both nations. Conversely, restricting exchange forces each nation to produce and consume at less than full capacity.

Trade theory also assumes that the welfare of all individuals is equally important, but in reality most nations are more concerned with citizen welfare than with the well-being of foreign nationals. Labor importation benefits aliens and their employers, but may force natives to compete with migrants for jobs, housing, and scarce public goods. Thus, even if total output in both nations increases, migration is "mutually beneficial" only if its effects on each country's income distribution are offsetting or relatively minor.

Another problem is that labor markets in sending countries are highly imperfect. Often, there is limited substitutability among workers of different skill levels. Such labor-market segmentation can make it difficult to fill specific vacancies caused by emigration, despite widespread unemployment, thus retarding economic development.

Finally, free migration is different from free trade in a fundamental way. A trade transaction is a mere commodity exchange. Labor flows consist of people, whose services are only rented, and whose desires can change in unpredictable ways. International trade theory fails to account for the willingness and capacity of migrants to adapt to life abroad.

Labor market impacts

The availability of migrant workers makes labor markets more competitive in the short run. Many migrants will work at or below prevailing wages, because they are accustomed to lower standards of living. Their belief that working in a wealthy society is a privilege usually retards unionization and limits complaints about working conditions, especially among migrants of doubtful legal status.[12] As a result some (usually the lower-skilled) sectors of the labor market experience slower growth in real wages.

If migrants and most domestic workers do not compete in the same labor markets, migration can promote dualism or labor-market segmentation, with each segment responding to separate economic and social forces. The availability of migrant labor preserves traditional labor-intensive agricultural, manufacturing, and service jobs. Employers in these sectors must choose between labor-intensive production based at least partially on low-wage foreign workers, or capital-intensive production using a smaller but more highly paid domestic work force. In general, it is the smallest operations which rely on alien labor to maintain production, because they lack capital or the skills to manage large-scale automated firms. Thus, migrant labor may help to preserve inefficient establishments which might otherwise fail in the face of foreign or domestic competition.

Illegal alien workers are more likely to be found in small firms for another reason. Small employers often know workers personally, maintain their own records, and sometimes operate on a "cash" basis. The employer who knowingly hires illegal workers can avoid paying his or her share of taxes for social security, unemployment insurance, and workers' compensation. And, because aliens generally do not understand the handling of payroll taxes, the employer may pocket the employee's share of these taxes as well. If uniform deductions are made from the wages of legal and illegal workers alike, take-home pay will be the same for both.

Payroll taxes on employer and employee, combined, range from 25 to 35 percent of a U.S. employer's total wage bill and up to 50 percent in Europe. They are forwarded by the employer to the appropriate revenue office, and are only verified when an employee files a claim for benefits. If the employer can assume that illegal workers will not attempt to obtain benefits for fear of apprehension, the tax savings from employing alien labor may contribute substantially to profits.[13] The extent to which tax evasion opportunities cause employers to hire aliens is not known, but the practice is common enough to be of concern in both the United States and Western Europe.

The rationale for labor importation

Legal guestworkers in industrialized societies are most often found in larger establishments because their employment imposes additional hiring and supervision costs. They must be recruited, screened, and transported, often housed in company-owned units, and either taught the host country's language or supervised by multilingual personnel. And, to protect the jobs of domestic workers, the recruitment of aliens often entails the payment of a fee to the labor ministry. Given these additional employment costs, why might employers hire guestworkers?

The answer lies in the relatively rigid wage structures characteristic of large firms in industrialized societies. Whether by tradition or contractual agreement, such structures are typically hierarchical, with well-defined wage differences among groups of workers. For example, in a hypothetical auto manufacturing plant employing 10,000, assembly-line workers earn $10 and skilled workers receive $15 per hour. A labor shortage develops on the assembly line which could be filled locally by raising assembly-line wages from $10 to $13. However, the additional cost of filling the openings is not simply $3 per hour times the number of vacant assembly-line jobs; rather, it is $3 per hour times all 10,000 jobs, or $30,000 per hour, in order to maintain previous wage differentials.[14] The profit-maximizing employer may elect to recruit foreign labor if the extra recruitment, housing, and supervisory expenses do not exceed the cost of hiring locally.

In other cases, changes in technology, industry structure, or educational attainment permit more native workers to obtain white-collar positions. The domestic supply of persons willing to fill unskilled industrial and service jobs is thus reduced. Employers, faced with the costs and uncertainties of restructuring existing wage levels and job status patterns, may see foreign labor as a surer and cheaper way to staff undesirable positions.

The migratory chain

Whether imported to fill permanent or temporary labor market gaps, foreign workers who gain a foothold in a host nation quickly make the immigration process self-feeding.[15] The first migrant workers are single males, but if the demand for labor persists, especially among service-sector employers, females immigrate. Some of the temporary workers form families, while others send for spouses and dependents as soon as they secure housing and obtain permission, usually after 1 year of employment if they have legal status, and longer if they are undocumented. A growing stock of foreign workers and their families then justifies additional immigration so that migrants can have access to familiar foods and services—the third stage in the migration process.

The fourth and final step in the migratory chain is *de facto* permanence. Individuals may come and go, but a growing core of foreign nationals acquires financial and personal equity in the host society. The proximate cause of this permanence is the persistence of employer "needs" for low-wage labor, which in turn results from the original choice to import labor rather than reorder domestic wage structures.[16] Thus, importing foreign workers does not solve domestic labor-market problems, but only postpones the need to address them.

In fact, importing workers often causes new problems. Most migrants initially anticipate a short stay abroad. However, they become permanent residents as they adjust to industrial life and its rewards; when they realize that their accumulated savings will not provide a better life back home; when they form or unite families abroad; when economic problems in their homelands persist or worsen; and when their current employers continue to offer jobs. They may go home only every third or fourth year, thus carefully preserving their right to return to a foreign job. When that right is threatened, many migrants simply refuse to leave. Some receiving societies have avoided such "backdoor" immigration by rotating imported workers periodically, but these policies are unpopular, and must be enforced through elaborate administrative and policing systems.

Permanent settlement changes the economic impacts of international labor flows. When settling, migrants demand housing and consumer durables, thereby increasing demand in host nations and creating yet more jobs. However, the net result of settlement may still be economically undesirable because of the concentration of immigrants by industry, occupation, and residence.

Migrant permanence alters the social impacts of labor exchanges, as well. Host countries initially benefit from the fact that imported workers do not require social infrastructure—health care, education, and other services. But permanent immigrants do require social investments if they and their children are to be brought up to host-country norms. Providing that infrastructure often involves a higher than usual per capita cost, because the children must be educated to function in both the sending and the receiving countries.

Such social investments might seem profitable if the children of immigrants were to fill the same labor-market roles their parents did. But migrant children adopt native attitudes quickly, and some reject the jobs so eagerly accepted by their parents.[17] Thus, the host nation finds itself again on a labor importation treadmill. In turn, each round of immigration results in more permanent residents, but fewer workers willing to fill undesirable jobs. And employers, rather than national policymakers, determine who these new residents will be, where they will locate, and how they will be integrated into the receiving society.

Impacts on sending societies

Demographic issues. Personal characteristics of emigrants help to determine the economic results of exporting labor. Males between the ages of 18 and 45 are generally first to be recruited, but must leave their dependents behind until they have met host-country service requirements for legal family unification (usually 1 year). As a result, the home-country labor force decreases, although some women take jobs vacated by the men; the age structure develops concentrations of young and old persons, who are often dependent on the 18- to 45-year-olds abroad; and birth rates decline, as some migrants delay marriage while others adopt the birth control practices of labor-receiving nations. Recruitment may be regionally selective as well, taking persons only from certain cities or areas.

Agricultural decline. The outflow of prime-aged workers should prompt agricultural land consolidation, a reform which usually results in increased productivity and output. Dependents remaining in rural villages often rely on remittances for virtually all of their income, but few guestworker families are willing to sell or lease their land, given the uncertainty of the breadwinner's tenure abroad. Thus, rather than being consolidated, land is left idle or farmed less intensively, and the nation may be required to increase food imports. At the same time, local rural labor shortages may lead to an irreversible decline in agricultural capital, as terraces go untended and irrigation systems collapse.[18]

Urbanization. Migrant labor is often recruited in "urban staging areas," a practice which accelerates growth in these cities. The trend toward urbanization is intensified if remittances from breadwinners abroad increase rural family incomes enough to permit relocation in cities. Often the result is an urban real estate "boom," which is unsupported by any increase in domestic output.

Industrial distortion. Domestic industry takes on an outward resemblance to "modern" industry abroad as a result of emigration. Because individual employers must compete with foreign recruiters for labor, emigration puts upward pressure on wages and increases employer uncertainty. Returned migrants, now familiar with sophisticated production techniques, may not wish to work in less capital-intensive industries at home. Rather, many returnees enter the domestic service sector, intending to support themselves with a small vehicle or establishment.

As a result, labor-exporting countries move directly from an agricultural focus to a service-oriented economy, bypassing the development of industrial capacity. In an economy fueled by foreign earnings, an insufficient industrial base encourages consumption of imported goods, and increases the nation's dependence on industrial societies. Perhaps the chief economic cause for skepticism about the true amount of "foreign aid" to be derived from exporting labor is the tendency of returned migrants to purchase "unproductive" capital or imported goods with their savings.

Economic development. In the aggregate, emigration is a source of foreign currency, and should thus be helpful to domestic development plans. But migrant earnings are an uncertain source of foreign exchange, because they fluctuate with short-term foreign labor demands and the savings and repatriation decisions of individual workers. Economic development is a long-term process, and development plans based on such a stream of remittances may be disrupted by recession in a labor-host nation, usually at a time when the labor-sending country most critically needs foreign exchange.

Political trends. Because there are far more labor-sending than receiving societies, and because national sovereignty implies the right to control immigration, sending nations have little influence over the immigration policies of labor-short countries. However, despite their heretofore limited role in international labor-force decision-making, these nations appear to have realized that the blessings of exporting workers are not unmixed.[19] In years preceding the European guestworker programs, labor-exporting countries usually cooperated with labor recruiters, helping to locate and screen workers in preparation for the trip abroad. During the early 1970's, however, many sending nations began to view their labor exports as subsidies to industrialized societies. The result has been ambivalence toward emigration; labor-exporting countries resent the worker emigration, but realize that they cannot provide full employment for their citizens.

The future of international labor migration

The study of past and present labor flows yields an important lesson for the future: despite the initial recruitment effort required, most temporary worker migrations are easier to start than to stop. The benefits from labor transfers are clear and immediate; the costs are distant and ambiguous. Availability of foreign labor distracts receiving nations from solving the job-market problems which first made it necessary to import workers. As aliens are assimilated by the receiving society and climb the economic ladder, new labor shortages develop which are similarly eased with imported labor. Temporary worker transfers thus become permanent migration channels. Subsequent attempts to block these channels are likely to result in illegal immigration.

Even so, pressures to initiate labor transfer programs will probably increase during the 1980's. Unequal economic, social and political development in coming years will reinforce wage and unemployment differences among nations. Most industrialized societies, for example, will experience sharp drops in numbers of new labor-force entrants as the effects of declining birth rates are felt, and female labor-force participation rates stabilize. During the same period, less developed countries may be experiencing unprecedented levels of unemployment. Such a combination of domestic and foreign influences would make it virtually impossible to limit worker migration. Therefore, a critical reevaluation of international labor flows by both sending and receiving countries is imperative.

During the next decade, the United States will be one of the first countries to debate the merits of a legal guestworker program.[20] The report of the Congressional Select Commission, due in March 1981, is not expected to address the question of guestworkers directly, but at least five bills now pending propose such programs. Supporters of these bills argue that the United States cannot seal its borders, that Mexico and other less developed nations need a "safety-valve" for their surplus labor, and that the United States must have alien labor to do its undesirable work. But opponents say that guestworkers provide immediate economic benefits to selected employers and consumers, but most of their costs to society-at-large are deferred to a later date. If the United States decides to continue to import labor, it should admit aliens as permanent immigrants, so that both benefits and costs are explicit from the outset. ☐

[3] Migration of this type was widespread in the late 19th century. Most of the "second wave" of immigration to the United States consisted of "target earnest," who hoped to return home with their accumulated savings. Return migration as a percentage of in-migration from 1908 to 1910 for various ethnic groups was estimated as follows: Croatian and Slovenian, 57 percent; French, 45 percent; Greek, 25 percent; Northern Italian, 63 percent; Southern Italian, 56 percent; Magyar, 65 percent; Polish, 31 percent; and Slovak, 59 percent. Rates for some groups were much lower, such as the 8 percent reported for Hebrews. The figures above are from the Dillingham Commission on Immigration, *Abstract of Reports of the Immigration Commission*, U.S. Senate, 61st Cong., 3d Sess., S. Doc. 747 (Washington, 1911), Vol. I, p. 182, table 16.

The changing composition of Europe's guestworker population

Although the flow of guestworkers diminished during the 1970's, wives joined men who remained; as the proportion of women migrants—now more than 40 percent—rose, labor market structures changed, as did socioeconomic implications for host countries

AYSE KUDAT AND MINE SABUNCUOGLU

The rapid economic recovery of Western Europe after World War II was accompanied by severe labor shortages. Consequently, European industries sought workers from other countries, and migrant labor flows increased significantly in the following decades. By the 1960's, approximately 800,000 workers were emigrating annually from the Mediterranean countries alone. When these flows peaked in the early 1970's, they were unmatched in scale by any other documented labor movement in history.

However, with the successive introduction of restrictive immigration measures by the labor-importing countries after 1970, the movement slowed and came to a virtual standstill with the onset of the 1973–74 oil crisis. During 1973–75, flows from the major labor-exporting countries within the Organization for Economic Cooperation and Development declined from 500,000 to 100,000, and approximately 600,000 workers returned to these sending countries during 1974–75. The great majority, however, managed to remain in the host countries during the crisis.[1]

In 1975, the share of foreign workers within the total labor force of six labor-importing countries (Austria, France, West Germany, the Netherlands, Switzerland, and Sweden) was slightly more than 10 percent, with considerable national differences. The individual shares ranged from a high of 24 percent in Switzerland to a low of 4.2 percent in the Netherlands. Those registered as unemployed among the total number of foreign workers in these countries averaged 5.7 percent. The share of foreign workers in the count of total persons unemployed in each country, however, was as high as 25 percent in Switzerland and as low as 4.5 percent in Sweden, with an average of nearly 12 percent in the six countries.[2]

Several trends have distinguished earlier phases of European labor migration from more recent ones. First, the majority of the early migrant workers were unskilled laborers. Even as late as the 1970's, 82 percent of all Mediterranean labor migrants in the Netherlands, for example, remained unskilled. By 1976, however, this figure had fallen to 25 percent as a result of more selective entry criteria as well as skill improvement among migrants.[3] Second, during the initial phases of the movement, migrant workers tended to remain in host countries for shorter periods. Stays progressively lengthened, however, as increased numbers of migrants were reunited with their spouses and children in host countries. Again, Dutch statistics indicate that in 1965 nearly one-third of foreign work-permit holders returned to their home countries, but that by 1970 this proportion had dwindled to 15 percent, and by 1973 had reached a low of 4.5 percent.[4]

Although a new peak in return migration was attained in the years immediately following the 1973 recession, relatively low levels of new worker inflow and

outflow have prevailed since 1976. Yet the influx of migrant family members, which was especially heavy after 1973, accounted for the fact that little overall change in the stock of migrants occurred despite a reduction in the number of those working. This influx resulted in a significant increase in the proportion of migrant women who, together with second-generation migrants, filled available job vacancies, thus mitigating the need for new labor importation. Indeed, approximately one-quarter of all European work permits issued to foreigners since 1970 have been for women.[5] And today, more than 40 percent of all migrants and 25 percent of migrant workers in Europe are women.

Some of the consequences of this massive movement of human resources are becoming increasingly clear now that new flows have significantly subsided and strategies for consolidation of existing migrant populations are being implemented in most European countries. Yet many new issues relating to the circumstances of the workers who have remained in host countries have also emerged as migrant families have reunited, expanded, and their offspring have matured and sought entry into the labor markets of host countries. Among these, the roles and problems of migrant women have been least explored.

In the following sections, data on migrants in Europe are examined with reference to the changing role of women. Sex-based differences observed among Yugoslav and Turkish migrants in West Berlin offer particularly interesting insights into the new character of Europe's guest-worker population.

More women guestworkers

In four major European labor-importing countries (West Germany, Austria, Switzerland, and the Netherlands) for which sex-specific information on immigrants is available, the proportions of women (working either in or outside the home) have been high throughout the past decade. In 1978, women constituted an average 37 percent of the largest migrant groups in the four countries. During 1974–78, the overall ratio of foreign resident and working women to men in West Germany and in Austria increased by 14.5 percent and 17.9 percent, respectively. In West Germany, increases in the female ratios among seven of the eight major foreign resident groups accounted for nearly 11 percent of this change, with Moroccans and Tunisians exhibiting the highest rates of increase. The data for each major group in West Germany, collectively representing 73.7 percent of all foreigners, are presented in table 1.

In Austria, where available statistics relate exclusively to new work-permit holders, growth in the proportions of female workers among major groups (representing 90.3 percent of the total foreign labor force) ranged from a high of 21.8 percent for Yugoslavs to a low of 3.2 percent for Italians. These data are presented in table 2.

Interestingly, the ratio of working German women in Austria decreased during 1974–78, and that of Italian women increased only marginally in comparison to the same ratios for Turkish and Yugoslav women. Female migration trends to the Netherlands have followed similar patterns. During 1976–78, the proportion of all female foreign residents from principal "recruitment countries" increased by nearly 10 percent. As shown in table 3, percent changes in these ratios among individual nationality groups ranged from a high of 34.7 percent for Moroccans to no change for Greeks. As in Austria and in West Germany, the rates of increase in the proportion of female migrants to the Netherlands have been the most pronounced among North African nationalities.

Swiss statistics. Data from Switzerland offer the most comprehensive and detailed basis for evaluating the extent and nature of female participation in labor migration to Europe. But economic structural differences between Switzerland and West Germany, for example, prevent generalization of the Swiss case to the overall European context. As a heavily industrialized country,

West Germany has traditionally attracted larger proportions of male migrant workers. In contrast, the predominantly service-oriented Swiss economy has offered less physically demanding work opportunities, attracting women as well as men from a wide range of developed and developing countries. According to recent Organization for Economic Cooperation and Development sources, 45.9 percent of all foreign residents in Switzerland (including annual work-permit holders) were women in 1978—the highest such percentage among the European countries examined here. Further, the female ratios among all major foreign groups were consistently high, ranging from 43.9 to 49.6 percent. A comparison of the data in tables 1 and 3 reveals that, in fact, the greatest variation in the sex-composition of different foreign groups was in West Germany.

An examination of sex-specific employment figures for five of the largest "permanent" immigrant groups in Switzerland in 1978 (presented in table 4) shows that female worker ratios in Switzerland paralleled the rates existing in Austria and in the Netherlands. However, during 1974–78, the overall female worker ratios in Switzerland only exhibited a 3.3-percent positive change as compared with 18.2 percent in Austria and 9.8 percent in the Netherlands. Percentage changes in the ratio of women among individual nationalities in the three countries were quite different. Whereas female worker ratios increased in almost all cases in Austria and in the Netherlands, these ratios declined in Switzerland among German, French, and Austrian workers; only Spanish and Italian women exhibited relative employment gains.

Swiss data for 1955–78 reveal even more distinct trends. Overall, the percentage change in the proportion of women among the groups represented was significantly negative during 1955–65, less so during 1965–74 and slightly positive during 1974–78. Among individual groups, the total number of German and Italian workers decreased by one-half over this entire period. Also, by 1978, the total number of Austrian workers fell to a quarter of the 1955 level. But, in contrast to the decline in the female proportion of German and Austrian workers during the 23-year period, the ratio of women among Italians increased during 1965–74, and again during 1974–78. The number of French and Spanish workers in Switzerland during 1955–78 increased by a factor of 5 and 6, respectively. The proportions of Spanish women increased by 18.7 percent during 1974–78, offsetting a decline of similar magnitude during 1965–74.

Switzerland is one of the rare cases in which sex-specific statistics on migrant populations have been systematically compiled according to types of migration. Tables 5 through 7 present such figures for annual, seasonal, and frontier workers. Table 5 indicates that the peak in the overall level of migration occurred in the mid-to-late 1960's. By 1978, migrant worker flows had decreased by over 50 percent; however, steady but slight growth occurred in the proportion of women. The female ratio among annual work-permit holders showed minor decreases while the proportion of women seasonal workers significantly increased. The volume of frontier workers doubled during this period, also with slight growth in female ratios.

Table 6 provides a breakdown of migrants by nationality and type of migration in 1978. Italians have predominated in permanent and seasonal migration to Switzerland, and approximated the French numbers in frontier migration. Following the Italians, Spaniards and Yugoslavs have assumed the bulk of seasonal and

annual work. This table also shows that female rates of participation in annual migration to Switzerland have been consistently high. Yet significant sex-discrepancies are evident among national groups in seasonal migration. Although the Italians, for example, have dominated the short-term labor market in Switzerland, Italian women represented a mere 6.4 percent in seasonal flows, the lowest rate among all the groups. A similar pattern was evident among Yugoslavs and Spaniards who, together with the Italians, constituted 60 percent of the short-term labor force.

Overall, approximately one-third of all these migrants in 1978 were women. The proportion of women among all annuals and frontier workers was about 38 percent, while their ratio among seasonal workers was only 13.2 percent. A look at the sectoral distribution of the three types of migrants presented in table 7 provides some possible explanations. Among annual workers, men assumed most of the jobs provided by the two largest employers of migrants—the metal and construction industries, whereas women predominated in textile clothing, health, and tourism (hotels and restaurants) occupations. A similar pattern occurred among border workers, except that more of these women were employed in commerce.

The majority of Switzerland's migrant seasonal workers were employed in the construction, tourism, and agricultural sectors. Only in tourism, the second largest employer of seasonal workers, did the proportion of women exceed 10 percent. Because women are generally considered unsuitable for industrial work, and particularly construction, their greatest concentration (80.8 percent of the seasonal female work force) was found in the tourism sector. Consequently, women number one-seventh of all men in the seasonal work force, as opposed to one-third for the short-term economy as a whole. Aside from the sectoral demand for such work, the ability of women to respond to seasonal work opportunities is typically limited by age and social circumstances. Married women with or without children generally will not leave home on a seasonal basis unless their family is destitute, or the male head of the household cannot find work. Possible exceptions to this are those cases in which the seasonal migration of entire families can be arranged.

Import of data on women. The preceding data shed some light on the role women play within differing migration patterns. But because of the paucity of comparable data in other contexts, as well as more detailed sex-specific data in general, important aspects of women's participation in labor migration remain unexplored. This is regrettable as sex-differences in modes of migration and sectoral distributions seem related to the status and welfare of foreign workers in host societies. The circumstances and roles of women who have migrated as dependents of their husbands, for example, presumably have a bearing on the size and nature of the illegal foreign female work force. In March 1980, illegal workers employed by the clothing industry in France organized a hunger strike which was supported by radical domestic political parties and trade unions. An estimated 25,000 persons, thought to be predominantly Turkish in origin, participated in the strike. Although no sex-specific estimates were released, the traditional preponderance of women in this industry (corroborated by the Swiss statistics) suggests that a significant proportion of the strikers were women. It would thus appear that in France, at least, migrants who experience great frustration and poor working conditions include those in industries with high proportions of women.

It is also common knowledge that the spouses and daughters of large numbers of migrants in France, Germany, and other European countries are increasingly employed "illegally" as domestic help. Even some legal women workers, and particularly those already employed in the domestic sector, take such unrecorded jobs to supplement their incomes. There has been no official acknowledgment of this fact, and little is known about the volume of such activities and the working conditions of the women involved.

The problem of migrants working illegally in Western Europe is somewhat different from the issue of illegal aliens working in the United States.[6] In Europe, the illegal workers are primarily women. Over the years, large numbers of women have migrated to Europe in a dependent status. With a spouse in Europe, the acquisition of entry permits for women has been generally easier than obtaining work permits.[7] Following their arrival, wives of migrants often seek to supplement relatively low family income in the host country. Thus, many probably work illegally, but their dependent status makes documentation of illegal work very difficult.

These issues suggest the need for more sex-specific data in migration research. Until now, analyses of labor migration have mostly concerned problems of overall national economic and social accommodation. Rarely have questions been asked about the differences in male and female migrant behavior and circumstances—for example, employment security, retirement rights, political organization, and union involvement. In general, it has been assumed that the needs of migrant women are taken care of by husbands, other male family members, or income from some form of legal employment. This conception clearly fails to address more subtle existing and potential trends that may threaten the economic, social, and political fabric of host systems.

Turks and Yugoslavs in West Berlin

In 1974, one of the authors and her colleagues surveyed 1,500 Turkish and 700 Yugoslav workers in West Berlin.[8] The data revealed interesting differences in economic and social status between working men and women of these two nationalities.

Prior to the survey, in June 1973, women constituted 30 percent of the total foreign labor force in all of West Germany as well as in West Berlin. Both in 1972 and in 1973 (the year of the official ban on new worker entries), the number of foreign women who obtained entry permits increased. Greeks, Yugoslavs, and Turks together accounted for 84 percent of all new immigrants during this period. Twenty-two percent of these were women. Of these women, nearly one-half were Turkish, and one-third were of Yugoslav origin. Further, the *Berlin Statistical Yearbook* reported that, in 1973, 40 percent of the Turks and 48 percent of the Yugoslavs employed in the city were women,[9] the largest such percentages for these two nationalities at any time in Europe.

Explanations for such high proportions of women include the fact that West Germany has served as a traditional destination for large numbers of Turkish and Yugoslav migrant workers. And in the early 1970's, migrants' wives were far more likely to accompany or join their spouses than in earlier years. In general, worker recruitment patterns in the 1970's contributed to a higher proportion of women among migrants. In West Germany, migrant women were accorded employment priority in the first half of the decade to fill vacancies in the electronics industry, largely concentrated in West Berlin. Large numbers of foreign women also independently took advantage of this opportunity, and joined their husbands in Germany. In the late 1970's, worker recruitment was severely curtailed, and entry permits restricted primarily to the immediate relatives and dependents of resident workers.

The priority given female immigrants stemmed largely from the advantages employers perceived in maintaining large female work forces. Employers

expected that women, particularly single ones, could be easily housed in dormitory-style living quarters, and they would pose fewer potential problems in terms of personnel management. They would be more pliable to authoritarian demands, and had shown little tendencies in the past to participate in organized labor movements in host countries. Employers thus viewed migrant women workers as a reliable source of cheap labor.

The results of the 1974 survey of Yugoslav and Turkish workers in West Berlin, in part, bear out some of these expectations. Among both groups, a significantly lower percentage of women were married than men. Among Yugoslavs, 42 percent of the women and 59 percent of the men were married; Turkish marriage rates were 72 percent for women and 89 percent for men. Only a small proportion of the married women in both cases had migrated with their spouses. As shown in table 8, 69.3 percent of the Turkish women had migrated either to join a spouse already in West Berlin, or to arrange a reunion there with him at a later date. In contrast, only 34.4 percent of the Yugoslav women migrated with such expectations. Over one-half of the Yugoslav women, and nearly a quarter of the Turkish women who claimed to be married came without their spouses, or were married in the host country. The average age of the men surveyed was 31 for Yugoslavs and 33 for Turks. The corresponding average ages among women were 29 and 30.

The majority of women workers were recruited through official immigration channels (71 percent of the Turks and 86 percent of the Yugoslavs). Both women and men who claimed to have been "tourists" or "visitors" upon arrival were a small minority among the workers in both national groups. Sex differences thus appear to have played a negligible role in the mode of migration. This runs counter to the popular view that women play a predominantly dependent role in migration, at least in West Berlin. However, sex differences appear to have assumed greater importance once the migrants entered the host system. For example, both Yugoslav and Turkish women exhibited low mobility—both geographically and in job status—relative to men. Eighty percent of the Turkish women, but only 58 percent of the Turkish men, claimed West Berlin as their first port of entry. These ratios were 93 percent and 85 percent for Yugoslav women and men, respectively.

The lower geographic mobility rates for Yugoslavs in general are explained in part by their shorter experience in international worker migration relative to Turks. The very low mobility rates for women of both nationalities may be explained both by the nature of their original placement in the job market and by their relative inexperience in labor force participation. Further, the geographic isolation of West Berlin from the rest of West Germany is a considerable obstacle to the mobility of new or inexperienced migrants. In this sense, the setting works in favor of employers who can expect less worker turnover and, hence, lower costs for on-the-job training.

On average, women changed jobs fewer times than men during their stay abroad. For example, in 1974, Turkish men changed their jobs an average of 2.2 times, whereas the figure for women was 1.6. Further, the average number of job changes among all Turks was greater than that among all Yugoslavs. Prior to arrival, less than half as many women as men among both nationalities had been employed in their home countries. More than two-thirds of the women in both groups became employed for the first time after migration. Women claiming previous employment in their home countries had been primarily unskilled workers. Among the few that reported prior skilled employment, there was a higher percentage of Turkish than Yugoslav women.

Upon arrival, the majority among both sexes of the two nationalities were employed in an unskilled capacity within the industrial sector. However, a dramatic skill improvement was observed among men in comparison with women. For instance, more than a third of the Yugoslav men who were unskilled workers at the time of arrival bettered their job status in a matter of a few years. In 1974, only 29 percent of Yugoslav men were employed as unskilled workers; 59 percent had be-

come skilled laborers, and another 12 percent, foremen. However, 94 percent of Yugoslav women remained in unskilled positions in 1974. Sex differences among the Turks were also significant, although not to the same extent. Seventy-two percent of the men as opposed to 95 percent of the women remained unskilled. The sectoral spread of men of both nationalities was also greater than that of women; although, over the years, the workers of both sexes shifted gradually from the industrial to the service and commercial sectors, parallel to the changes in the sectoral distribution of the indigenous labor force. Data for these distributions in 1974 are presented in table 9.

Most of the workers surveyed from both nationalities had limited residence and work permits, with an average 1-year duration. The average length of women's permits was somewhat shorter than men's. This pattern was more consistent among Yugoslav than Turkish women. Significantly, very few among all the workers in both groups had acquired unlimited residence permits;[10] again, the ratio of women with flexible permits was lower in general than that of men. Almost 90 percent of the Turks claimed to have no knowledge of long-term permits, thus contributing to the low ratio for Turkish women. Yet less than 30 percent of the Yugoslavs responded negatively, with evident sex differences. The best explanation may be that the shorter national experience of Yugoslavs in international labor migration may have precluded the qualification of many of these workers for such permits at the time of the survey, because application for longer term permits is possible only after 5 years continuous residence in West Germany.

These patterns also are supported by the findings that a far lower percentage of Turks than Yugoslavs had been educated beyond the primary level or exhibited competance in German (with negligible sex differences). Surprisingly, however, a far greater percentage of Turks than Yugoslavs had acquired union membership in West Germany. This ratio for Turkish men was nearly double the Yogoslav ratio, and the ratio for Turkish women was nearly triple that of Yugoslavs. There is an open question as to why proportionately more Turkish women joined unions than their Yugoslav counterparts. One obvious reason is that many Turkish women joined unions because their compatriots were members.

What next?

The increased presence of women in European and international labor migration needs further attention. The evidence presented here suggests that sex differences in labor migration have important social and economic implications for the migrant population as well as for the host country.

Increasing numbers of women migrants redefine the needs of the foreign population and thereby change the infrastructural costs for the host countries. The influx of women migrants has further amplified the already apparent duality in the European labor market. With migrant women replacing native women as well as migrant men in the worst paid sectors, the latter groups may shift to jobs with higher pay and greater social benefits.

The economic and social implications of female immigrant workers are clearly different from those associated with male migrants—if only because of the added potential for future generations of an immigrant population. Many of the resulting socioeconomic problems could be dealt with more effectively by anticipating trends. For example, migrant sex ratios examined on a longitudinal basis would identify patterns which signal the nature and potential volume of future demands for employment, education, health and child care, housing, and other social services that might be made on public resources. High fertility rates among migrant women, such as those in Europe, amplify the magnitude of these potential demands, especially in host countries with low population growth.[11]

Past research has shown that the migration of men and women is primarily motivated by economic factors. But the specific nature of the "push" and "pull" factors affecting women migrants awaits greater clarification. The significant nationality discrepancies found to exist among migrant women in Europe suggest that motivational factors vary among groups. Thus, a thorough investigation of migrant women's economic and social circumstances, as well as policies governing their migration in host and home countries should be undertaken. In particular, the circumstances surrounding return migration of migrant women also requires more focused attention. A second survey of 2,519 Turkish migrants returning home from West Berlin between January 1975 and June 1976 has revealed, for example, that not all workers were leaving because of unemployment.[12] Fewer male and female returning migrants were unemployed than had voluntarily quit their jobs before departure. This was especially the case among women. Furthermore, family responsibility accounted for 80 to 90 percent of the reasons given for departure among women. This constrasts sharply with the responses in 1974 indicating that a high percentage of women were recruited to West Berlin for employment purposes.

Although a full description of this second survey and its results cannot be presented here, the findings alluded to above suffice to illustrate the need for more detailed information on the female component of international labor migration. For example, how do the characteristics of female migrants returning home differ from those remaining in host countries? what personal effects does migratory movement have on women and their families? and what are the prospects for integration and reintegration of migrant women into host and home societies?

Migrant populations are an increasingly important and dynamic factor of economic and social importance in a world more closely linked by improved transportation and communication. Thus, the role of migrant women is of special salience. However, this role cannot be properly assessed on the basis of national aggregate statistics alone. Only a combination of macro and micro-level information, disaggregated according to sex, will provide a suitable foundation for a realistic understanding of the problems and prospects of migrant workers throughout the world. □

[7] For example, in West Germany, spouses and unmarried children are allowed to join a foreign worker after the latter has completed a 1-year residence in the host country. Until April 1979, a workers family members were allowed access to the labor market providing they had entered West Germany before certain "key dates"; however, the new regulation requires a waiting period. Children of workers who are of legal employment age can now acquire a "general work permit" after a 2-year residence (those having completed 6 months of vocational training are granted immediate access). Spouses are now granted special permits for work in sectors where there are labor shortages, and this only after a 3 or 4-year residence. Further, these provisions are completely at the discretion of the Labor Institute and apply to jobs for which German nationals have not been granted precedence. See SOPEMI, 1979, p. 41.

[10] Until Oct. 1, 1978, unlimited work permits were available to all foreigners with 10 years residence in West Germany, who could demonstrate some proficiency in German and establish a legal claim for residence. This waiting period has now been reduced to 8 years. However, such a permit will now be issued after 5 years provided the applicant has reasonable housing, simple oral proficiency in German, and children who have been properly enrolled in school. See SOPEMI, 1979, p. 42.

[11] In 1965, for example, foreigners and migrant workers constituted .6 percent and 1.4 percent of the overall population and labor force in West Berlin, respectively. The corresponding ratios in 1974 were 4.3 percent and 12 percent. During the second half of the 1970's, each of these ratios approximated 10 percent, with nearly half of all births in the city being accounted for by migrant populations.

[12] This survey was sponsored by the Berlin Science Center and implemented in cooperation with the Turkish Consulate in West Berlin. Its results have not yet been published.

Documenting the undocumented: data, like aliens, are elusive

Millions of illegal immigrants currently live and work in the United States, but efforts to estimate their economic and societal impact are hampered by a lack of valid information

ELLEN SEHGAL AND JOYCE VIALET

Most undocumented, or illegal, aliens enter the country unlawfully, bypassing inspection and other procedures required by the Immigration and Nationality Act. A smaller number enter legally and subsequently violate the terms of their admission, generally by overstaying their temporary visas and accepting unauthorized employment. Increasingly large numbers of illegal immigrants have been apprehended by the Immigration and Naturalization Service over the past decade. In 1977 alone, the agency apprehended 1,042,215 deportable aliens, more than double the 462,315 immigrants legally admitted that year.

It is generally believed that more illegal aliens escape detection than are apprehended and that they may contribute to a number of social and economic problems, including unemployment. At issue, then, is how best to reduce the number and presumably adverse impact of undocumented aliens in the United States. The problem is especially difficult because there are no exact facts and figures concerning illegal immigrants, their numbers, or their effective role in the U.S. labor market.

Research—limitations and accomplishments

Data problems. Research in this area has been severely hampered by the difficulty in collecting valid data; one cannot know the "universe" of illegal immigrants, or obtain a representative sample. One would assume that the aliens and their employers would be reluctant to respond to official interviews. And research findings based on interviews with apprehended aliens or with migrants who have returned to their homes may not necessarily apply to those who have remained in this country undetected.

The Immigration and Naturalization Service (INS) collects data on arrests for law enforcement purposes, but the resulting information is of limited value in research. INS apprehension statistics record occurrences, not persons, and thus are subject to considerable overcounting. And Mexicans are far more likely to be located than other foreign nationals, because the efforts of the INS are concentrated along the U.S.-Mexican border. In fiscal 1977 for example, 92 percent (954,778) of the deportable aliens found by the agency were Mexican citizens.

Recent research efforts. A number of research efforts have attempted to estimate the numbers of undocumented aliens in the United States. The results of six of these are summarized in exhibit 1. As indicated previously, Mexican nationals account for an overwhelming majority of INS apprehensions, and are the focus of the greater part of research on illegal immigrants to this country.

Of particular interest is the study conducted by Clarise Lancaster and Frederick Scheuren of the Social Security Administration. The authors used two estimates of the U.S. population, one which included illegal immigrants, and the other excluding them. The latter, a

population estimate of the Census Bureau updating a corrected 1970 census count, was subtracted from the estimate which included undocumented aliens. That estimate, in turn, was based on the March 1973 Current Population Survey sample, which had been matched with individual Federal income tax and social security records.

Lancaster and Scheuren estimated that there were about 3.9 million 18- to 44-year-old illegal immigrants in the United States in April 1973, but noted that the actual figure could be anywhere between 2.9 and 5.7 million. They also cautioned that their work should be considered exploratory, citing a number of limitations in both the data and the assumptions underlying the

analysis. For example, the data used were subject to matching and survey coverage errors; and, the nature of the methodology was such that the illegal population estimates were retained as a residual and thus may be of questionable accuracy.[1]

More information is available on the characteristics of undocumented aliens than on their numbers. Studies of persons apprehended consistently show that workers from Mexico are predominantly young men, who are poorly educated, and have a limited command of English. They come to the United States to find work, and send a large part of their earnings back to their families.

There is less information on illegal migrants from other parts of the world, although it is thought that they are generally better educated and better off financially than those from Mexico. Many enter this country legally on temporary tourist visas, but overstay their visas and find jobs. The results of a major study also indicate that they tend to be somewhat older than Mexican entrants; more are married with family members present; they are more likely to speak English; and they report higher earnings.[2]

Economic effects of illegal migration. Studies have consistently found that the principal impact of illegal migration is on the labor market. Because of the economic imbalance between the United States and less developed nations, citizens of the Third World may perceive illegal immigration as their only means of escape from poverty.

Available information indicates that many U.S. employers are willing to hire undocumented workers in spite of, and sometimes because of, their illegal status. Such workers, accustomed to the lower standards of living of their home economies, will frequently work for lower wages than U.S. natives. They are also susceptible to exploitation in the form of substandard working conditions and minimal fringe benefits because they fear being reported to the Immigration and Naturalization Service.

Therefore, many observers believe that this source of cheap labor, if available on a fairly constant basis, has an adverse effect on U.S. wage standards and working conditions. Illegal aliens may also displace native workers, adding to the country's already serious regional and national unemployment problems. Concern over this issue, formerly focused primarily on the Southwest border and on agriculture, has now extended to other regions and ctors of the economy.

However, some analysts contend that most undocumented aliens take jobs which native workers will not accept at existing wage levels. They argue further that, without migrant labor, many low-wage industries would be forced to shut down or move abroad, thereby costing U.S. workers jobs.

Legislation and other Federal response

Administration initiatives. On January 6, 1975, President Ford established a Cabinet-level Domestic Council Committee on Illegal Aliens. The preliminary report of this committee was released in January 1977. While it contained no numerical estimates, the report stated that illegal immigration was a significant and growing problem, and recommended legislation establishing penalties for the knowing employment of undocumented workers.

The issue continued to receive extensive study by the Carter Administration. On August 4, 1977, President Carter submitted a message to the 95th Congress, outlining a "set of actions to help markedly reduce the increasing flow of undocumented aliens in this country and to regulate the presence of the millions of undocumented aliens already here." Included in the proposal were: civil penalties for the employment of illegal aliens; increased Southwest border enforcement; more vigorous administration of labor standards legislation; continued cooperation with major migrant-source countries in order to improve their economies; permanent resident status for eligible aliens who had been in the United States continuously prior to January 1, 1970; and 5-year temporary resident status for aliens who had been here continuously as of January 1, 1977. At the same time, the President indicated support of pending legislation to increase the annual limitation on Mexican and Canadian immigration from 20,000 each to a combined total of 50,000.

This Administration initiative represented an attempt to balance the various conflicting interests involved in the complex and controversial illegal alien issue. Foreign policy considerations, such as the predictable adverse reaction of the Mexican government to any drastic change in the status quo, had to be weighed against domestic factors, including the impact of foreign workers on the U.S. labor market. It was in the latter area that the research on undocumented aliens was most relevant. For example, the decision to request increased enforcement of minimum wage and other labor standards legislation was in keeping with findings of labor-market exploitation of undocumented workers. By minimizing the economic incentive to hire aliens, their employment would presumably be reduced.

In connection with the employer sanctions proposal, however, the President also had to consider the interests of U.S. employers, who stressed enforcement difficulties; of Hispanic groups and the U.S. Catholic Conference, which were concerned that legal residents (particularly Hispanics) would encounter hiring discrimination because employers would not want to risk violating the law; and of civil libertarians, who feared that the plan would require each citizen to carry an identity card, a practice viewed as an invasion of privacy. The Administration bill, entitled the "Alien Adjustment and Employment Act," did not receive action beyond a Senate Judiciary Committee hearing in May 1978.

Congressional action. Legislative solutions to the problem of mass illegal entry have been under congressional study since the early 1970's. In 1974, the 93rd Congress amended the Farm Labor Contractor Registration Act of 1963 to strengthen administrative, civil, and criminal penalties for farm labor contractors who knowingly engage the services of illegal aliens. During the same Congress, a bill (H.R. 982) proposing a graduated series of civil and criminal penalties of increasing severity for other employers of undocumented workers passed the House but was not acted on by the Senate Judiciary Committee.

During the 94th Congress, consideration was given to another bill (H.R. 8713), which would have made it unlawful to knowingly employ illegal aliens, and would have provided injunctive remedies as well as civil and criminal penalties for violation. Unlike previous bills, it also authorized the Attorney General to take civil action against employers who discriminated against U.S. citizens on the grounds of national origin, and provided an amnesty for certain undocumented workers who had entered the country prior to June 30, 1968. This bill was favorably reported by the full Judiciary Committee, but was not brought before the House for a vote.

On the Senate side during the 94th Congress, omnibus legislation (S. 3074) was introduced which included graduated civil penalties for the knowing employment of illegal aliens, an injunctive remedy, and a provision allowing certain aliens who entered the country illegally prior to July 1, 1968, to establish a record of lawful admission. This bill was not reported to the full Judiciary Committee.

Legislation which was enacted by the 94th Congress, the Immigration and Nationality Act Amendments of 1976,[3] included a provision prohibiting aliens who have entered the country legally as nonimmigrants, and who have subsequently violated the terms of their admission by accepting unauthorized employment, from adjusting their status to that of permanent resident alien while in the United States. The provision was intended to deter tourists, foreign students, and other nonimmigrants from working illegally. The 1976 Amendments also extended to the Western Hemisphere an immigration preference system and a 20,000-person annual limit for each country, provisions previously in effect only for Eastern Hemisphere countries.

The 95th Congress amended the Immigration and Nationality Act to provide for the seizure and forfeiture of vehicles used to illegally transport aliens into the United States.[4] In another relevant enactment, the same Congress combined the Eastern and Western Hemisphere ceilings on immigration into a worldwide ceiling of 290,000.[5] Additionally, it created a 16-member Select Commission on Immigration and Refugee Policy, composed of four members each from the House and Senate Judiciary Committees, four Cabinet members, and four members appointed by the President.

The Commission is to report to the President and the Congress by March 1, 1981, on its administrative and legislative recommendations relating to the admission of immigrants and refugees. Without question, the issue of undocumented aliens will be of major concern to its members. Both the Administration and the Legislature appear to be awaiting Commission findings before acting in an area where political controversy is severely compounded by lack of reliable data. □

Immigrant earnings patterns by sex, race, and ethnic groupings

Based on 1970 census data, most immigrant men reach earnings equality with the native born in 11 to 15 years; for women, earnings following arrival vary more by racial and ethnic group; skills and motive for moving affect performance

BARRY R. CHISWICK

How well and how quickly immigrants adapt to a new life in the United States concerns policymakers as well as the public. Responses to the recent arrival of Cuban and Indochinese immigrants discussed elsewhere in this issue reflect the concern over the ability of these groups to assimilate into U.S. society. On an economic basis, the success of immigrants in the United States can be measured by their level of earnings following arrival. Some immigrant groups tend to reach earnings equality with the native population more quickly than others. An examination of these patterns could provide clues about the future earnings performance of those newly arrived.

This article summarizes the findings on the earnings and occupational mobility of immigrants from a large ongoing analysis of the economic adjustment of immigrants and how they compare with the native population.[1] Presented here, with the use of economic theory and statistical analysis, is an assessment of immigrants' economic progress relative to that of their native-born racial and ethnic counterparts. The purpose of the entire project is to add to the currently insufficient research base regarding immigrants.

Immigrant earnings theory

A theoretical analysis of the earnings of immigrants may be based on two concepts—the international transferability of the skills acquired in the country of origin and the "self-selection" of immigrants. The weaker the transferability of schooling and on-the-job training, the smaller the effect of these skills on future earnings and the lower they will be just after immigration. With the passage of time, however, the relative earnings of immigrants would rise as they acquire information, credentials, and marketable skills.

Persons who become international migrants tend to be different from those who remain. Migrants typically have greater innate ability, greater motivation for personal economic advancement, and are more willing to sacrifice current consumption to make investments that may increase future consumption. Such self-selected immigrants would tend to have higher earnings than the native born in the destination, if it were not for the disadvantages of being foreign born. Combining the effects of skill transferability and favorable self-selection suggests that the earnings of the foreign born may eventually equal and then surpass those of the native born. The year at which this earnings cross-over occurs can be estimated.

Data on various measures of "achievement" suggest that it may be transmitted from one generation to the next, but with a "regression to the mean." That is, the children of high achievers tend to have higher-than-average achievement which is nonetheless lower than that of their parents.[2] (The reverse is true for offspring of low achievers.) This suggests that the children of immigrants would tend to have an earnings advantage over other children if it were not for the disadvantages of be-

ing raised in a household that is less familiar with the language and customs of the country. It also implies that this advantage would disappear asymptotically with successive generations.

Analytically, it is useful to consider three groups: "economic migrants," those who move primarily for their own economic betterment; "refugees," those who move primarily out of concern for their personal safety or for political or ideological reasons; and "tied movers," those who move primarily to join or accompany a family member. Although refugees sometimes have a higher level of schooling than economic migrants, their skills are often less readily transferable internationally. For example, lawyers and judges, who have country-specific skills, appear in refugee populations but are seldom economic migrants. In addition, although refugees may, arguably, have more innate ability and work motivation than the population which remains at home, the difference is likely to be smaller for refugees than for economic migrants. As would be expected, tied movers generally have skills that are less readily transferable than those of economic migrants.

It is not easy to identify the primary motive for migration. The immigration category under which a person enters a country (family reunification, scarce skills, refugee, and so on) is often unrelated to motive. However, immigrant groups from some countries at certain periods are likely to include a larger proportion of refugees. Examples of this are the Chinese beginning in 1949, the Cubans beginning in 1959, and the Southeast Asians beginning in 1975. Wives, especially those of Americans, are more likely to be tied movers than are other immigrant women with the same demographic characteristics.

Earnings of men

The most recent analyses of earnings for foreign-born and foreign-parentage men in the United States use data from the 1970 Census of Population (Public Use Sample, State files, one-in-a-hundred samples from the 5-percent and 15-percent questionnaires). In spite of the substantial differences among the various racial and ethnic groups studied, quite stable patterns emerge when the immigrant generations are compared within racial and ethnic groups (table 1).

Table 1. Comparison of earnings and earnings related characteristics for native-born and foreign-born adult men in the United States, by racial and ethnic group, 1970[1]

Racial and ethnic group and nativity[2]	Means				Years since migration at earnings crossover[3]
	Average earnings	Average schooling (years)	Average age	Years since migration	
White:					
Native	9,738	11.9	42.8	....	....
Foreign	9,662	10.8	45.6	21.7	13
Cuban:					
Native	10,341	12.3	43.6	....	....
Foreign	6,857	10.8	42.2	7.2	18
Mexican:					
Native	6,523	8.9	39.6	....	....
Foreign	5,474	6.1	41.9	18.0	15
Black:					
Native	6,138	9.9	41.8	....	....
Foreign	6,585	11.0	40.4	11.3	11
Asian:					
Japanese:					
Native	10,389	12.6	43.6	....	....
Foreign	9,191	14.3	38.4	10.9	18
Chinese:					
Native	10,745	12.7	41.8	....	....
Foreign	8,019	11.9	42.8	16.8	(4)
Filipino:					
Native	7,010	11.1	36.8	....	....
Foreign	7,086	11.0	44.6	18.9	13

[1] Men aged 25 to 64 in 1970 who worked and had earnings in 1969 and, for the analyses for black and Asian immigrants, were not enrolled in school in 1970.

[2] Race/ethnic identity is defined by the race and Spanish origin variables. White men are used as the native-born comparison group in the Cuban analysis. The Mexican analysis is for Arizona, California, Colorado, New Mexico, and Texas. The Cuban and black analyses are for urban areas.

[3] The number of years in the United States at which the earnings of the foreign born equal the earnings of the native born, when other variables are held constant.

[4] The earnings of Chinese immigrants approach but do not equal the earnings of native-born Chinese-Americans, even after 3 decades in the United States.

SOURCE: *1970 Census of Population*, Public Use Sample, 5-percent questionnaire, 1/100 sample, except for a 1/1,000 sample for the white analysis.

Other things the same, schooling and preimmigration labor-market experience of the foreign born have a smaller effect on U.S. earnings than skills acquired by the native born (table 2). For example, among white men, an extra year of schooling raises earnings by 7.2 percent for the native born and 5.7 percent for the foreign born. The effect of schooling and preimmigration experience is particularly small for refugee groups; an extra year of schooling raises earnings by only 3.1 percent for Cuban immigrants and 4.8 percent for Chinese immigrants, the two groups with the largest proportion of refugees. In addition, there is a larger partial effect on earnings of schooling and labor-market experience for white and black immigrants from English-language countries than for those from other countries, reflecting the greater transferability of the skills acquired in the country of origin.

The effect of time in the United States on earnings, controlling for schooling and total labor market experience, is quite large (table 2). The differential effect of U.S. labor market experience compared with that abroad is greatest for immigrants with the weakest transferability of skills—refugees from other than English-language countries, Cubans and Chinese. It is smallest for those with highly transferable skills—economic migrants from English-language countries.

What is the progress of male immigrants relative to native-born men? Other things equal, the earnings of economic migrants equal those of the native born (or those with native-born parents) of the same racial and ethnic group after 11 to 15 years in the United States; beyond this point, immigrants have higher earnings (table 1). For example, among whites the earnings of foreigners are 10 percent lower than those of natives after 5 years of residence, 3 percent lower after 10 years, equal to the natives after 13 years, and 6 percent higher after 20 years. Among Mexican-Americans, the earnings cross-over occurs at about 15 years; among Filipinos, at about 13 years; and among blacks, it occurs at 11 years for the country as a whole and 13 years if the data are limited to urban New York State, the home of two-thirds of foreign-born blacks. Among the Japanese, the earnings cross-over is also in the 11 to 15-year interval if the comparison is with third-generation Americans. The earnings cross-over occurs later, or does not occur at all, for refugees; that is, for the Cuban and Chinese immigrants under study.[3]

The rise in the relative economic position of immigrants based on their duration of residence is found in longitudinal data on earnings and occupational status. In the National Longitudinal Survey file for older men, earnings increased more rapidly from 1965 to 1973 for the foreign born than for the native born, other things the same. Evidence of this relationship also appears in the longitudinal analysis of the occupational mobility (1965 to 1970) of white male immigrants using 1970 census data. The occupational mobility of male immigrants exhibits a U-shaped pattern; that is, occupational status declines when the "last" occupation in the country of origin is compared with the "early" U.S. occupation, after which upward occupational mobility is greater for the foreign born than for the native born. This U-shaped pattern is most intense for those whose skills are the least transferable (Cuban refugees) and least intense for those with highly transferable skills (English-speaking economic migrants).

Table 2. Partial effects on earnings of schooling and labor market experience for adult men in the United States, 1970[1]

Racial and ethnic group	Average percent change in earnings for an additional year —				
	of schooling for natives	of schooling for immigrants	of U.S. labor market experience for natives	of foreign labor market experience for immigrants[2]	of U.S. labor market experience for immigrants[3]
White:	7.2	5.7	2.13	1.41	1.12
Cuban (urban)	7.3	3.1	2.22	0.33	2.37
Mexican (Southwest)	5.2	3.9	1.80	1.67	1.34
Black (urban)	4.6	3.3	.78	1.18	1.60
Asian:					
Japanese	6.3	5.9	1.73	1.52	2.38
Chinese	6.7	4.8	2.73	[4]0.60	2.70
Filipino	5.8	6.4	1.30	1.46	1.94

NOTE: Unless indicated otherwise, the explanatory variables are statistically significant.

[1] The foreign born are compared with native-born men of the same racial and ethnic group, except for the Cubans where the comparison is with native-born urban white men. Unless noted otherwise, the data are for men age 25 to 64 in 1970, who worked at least 1 week and had earnings (wage, salary, and self-employment income) in 1969. The analyses for black and for Asian men exclude persons enrolled in school in 1970. The parameters are estimated from a linear regression of the natural logarithm of earnings on schooling, labor market experience and its square, the logarithm of weeks worked, marital status, and geographic area and, for the foreign born, years since migration and its square.

[2] The quadratic experience variables (T, T^2) were evaluated at $T = 10$.

[3] The quadratic years since migration variables (YSM, YSM^2) were evaluated at YSM = 10. The value measures the differential effect of an extra year of labor market experience in the United States rather than in the country of origin.

[4] Set of country-of-origin experience variables (T, T^2) has no significant effect on earnings.

SOURCE: *1970 Census of Population*, Public Use Sample, 5-percent questionnaire, 1/100 sample, except for a 1/1,000 sample for the white analysis.

Table 3. Relative earnings advantage of native-born U.S. men with foreign-born parents over native-born men with native-born parents, by racial and ethnic group, 1970[1]

Racial and ethnic group	Earnings advantage[2] (in percent)	
White:	4.9	
Mexican[3]	5.1	([4]8.6)
Black:		
All States (urban)	[4]6.4	
New York State (SMSA)	[4]10.7	
Asian:		
Japanese	[4]5.2	
Chinese	[4]4.3	
Filipino	[4]9.0	

NOTE: All coefficients are statistically significant, except for the Japanese, Chinese, and Filipino groups. The sample size for each Asian group was very small for native-born men with both parents native born.

[1] Earnings in 1969 for native-born men, age 25 to 64 in 1970, who worked and had earnings in 1969. There were too few native-born men with Cuban-born parents for an analysis of this group.

[2] The parameter is 100 times the coefficient of a foreign parentage dichotomous variable when the natural logarithm of earnings is regressed on schooling, experience, marital status, the log of weeks worked, geographic area, nativity of parents, and, in some equations, mother tongue. For small values, the parameter is the percent difference in earnings. A positive value indicates higher earnings for those with foreign-born parents (one or both).

[3] Men with Spanish surnames living in Arizona, California, Colorado, New Mexico, and Texas.

[4] Mother tongue is held constant. Evaluated for a Spanish mother tongue in the Mexican analysis and an English mother tongue in the black analysis.

SOURCE: *1970 Census of Population*, Public Use Sample, 15-percent questionnaire, 1/1,000 sample for the white men, and 1/100 sample for other groups.

Second-generation American men are about the same age and have the same schooling as those with both parents born in the United States, but other things being equal they had a 5 to 10-percent earnings advantage in the 1970 census data (table 3). In the National Longitudinal Survey (NLS), but not in the census, third-generation Americans can be compared with fourth and later generations. Analyses using the NLS file for older white men suggest that the earnings advantage of the foreign-origin population is smaller and may disappear by the third generation. Although the second generation has a significant 6-percent earnings advantage over the third generation, the latter has either no earnings advantage or only a small positive advantage (1.0 to 4.0 percent, not statistically significant) over later-generation Americans. This represents a "regression to the mean" in the earnings performance of the foreign-origin population with successive generations born in the United States.

Faster equality for most immigrant women

An analysis of the earnings of immigrant women for the same seven groups, using the same data from the 1970 census, shows patterns similar to the men but with greater variability by race and ethnic origin. Among women who worked, schooling and preimmigration labor market experience of the foreign born have a smaller effect on U.S. hourly earnings than the skills of the native born. The relative difference in the effect of schooling is greatest for the immigrant groups that include the largest proportion of refugees and tied movers.

When there is an earnings cross-over for women, it occurs sooner than for men. On average, just after they arrive, white women have higher hourly earnings than natives, and the gap widens over time. For most groups of nonwhite immigrants, hourly earnings equal those of natives of the same racial and ethnic group within about 5 years. However, among Mexican and Filipino immigrants, time in the United States appears to have no differential effect on earnings (controlling for total potential experience), and their earnings never equal those of women born here of similar descent.

Persons who migrate primarily because of their spouse's job opportunities tend to have less readily transferable skills and are obviously not necessarily economic migrants. Women who married prior to immigration and whose migration decisions therefore may have been influenced in large part by their husband's are found to have lower earnings. For example, among white women, those who married prior to immigration have earnings that are lower by 3 percent, a significant difference. The earnings disadvantage is particularly great for Asian women who married U.S. servicemen.

Women of the second generation earn more than women with native-born parents, other things being equal. The estimated earnings advantage of the former in each of the groups studied is consistent with the 5 to 10-percent earnings advantage found among men of the second generation.

Economic implications

There are clear patterns of racial and ethnic differences in the economic success of immigrants in the United States, even though there is substantial variation in the earnings of individuals within each group. Among the groups studied by immigrant generation, Mexicans and Filipinos tend to have low earnings compared with whites, both overall and when other variables are the same; whereas this is not the situation for those of Japanese and Chinese descent. These findings challenge conventional notions about the impact of discrimination on the schooling and earnings of racial and ethnic minorities.

The impact of immigrants on the native population changes with their length of residence, as they acquire new skills. The longer immigrants reside in the United States and the more their skills generate an economic return comparable to that of the native population, the smaller their adverse effect or the larger their favorable effect on the wages of low-skilled native workers, the smaller their use of income transfers for the poor, and the more favorable is their effect on the aggregate income of the native population.

Economic migrants are likely to have a more favorable impact than refugees or tied movers of the same demographic characteristics and level of schooling, because the former tend to have relatively higher earnings. Among potential economic migrants, those selected by U.S. immigration policy on the basis of their likely productivity in this country will tend to have a more favorable impact than immigrants selected under alternative rationing mechanisms, such as kinship or a first-come, first-served system. The immigration policies of the United States and many other countries, however, include special preferences for refugees and the relatives of citizens and resident aliens because of humanitarian and foreign policy objectives, as well as for domestic social and political considerations. These other objectives, however, have economic costs. ☐

Nonimmigrant workers: visiting labor force participants

Working visitors include students, laborers, and professionals; most require sponsors, and those in health fields must now pass tough entry tests; to obtain controversial temporary alien labor, employers must show that U.S. workers are unavailable

DAVID S. NORTH

The term "nonimmigrant" is an awkward one, typical of the often negative lexicon within the immigration field. Traditionally, all aliens seeking admission to the United States have been viewed as intending immigrants, until proven otherwise. Those who show that they do not intend to stay here for the rest of their lives are thus viewed as nonimmigrants.

Millions of nonimmigrants are admitted to the United States each year (more than 8.2 million in fiscal year 1978). Fully 80 percent of them are simply tourists,[1] and the balance come to pursue other activities, including work. Of those who come to work, many are not actually employed in the U.S. labor market. There are, for example, diplomats representing their nations in Washington, international civil servants working for the United Nations in New York, and representatives of foreign business concerns seeking markets, raw materials, or technology. None of these temporary entrants performs work normally assigned to U.S. residents.

There are, however, five classes of nonimmigrants who can and do work in the U.S. labor market: students, temporary workers of distinguished merit and ability, other temporary workers, exchange visitors, and intracompany transferees (employees of multinational corporations). Although their numbers are not large, compared to total nonimmigrant admissions, they play interesting—and sometimes controversial—roles in our society. They are, in a sense, the American equivalent of Europe's guestworkers; many of them (those working in agriculture) are modern *braceros*, the term for Mexican nationals who worked for low wages in U.S. agriculture during 1942–64 in the largest nonimmigrant worker program in our history.

In a recent study, the interaction of the five classes with the U.S. labor market was examined.[2] A thumbnail sketch of each category appears in exhibit 1.

A majority of the members of most of the classes are "bonded" to their employers. Bonded workers' right of residence in the United States is tied to their prearranged employment. They do not have legal access to other jobs in the United States, and if they cease working for the employer that brought them into the country they are no longer legally entitled to remain and are subject to deportation. The bonding concept is not an inevitable characteristic of alien worker programs; legal immigrants in the United States and many guestworkers in Europe are not bonded to their employers.

Program summaries

Each of the five programs of interest was created for a specific purpose, and has its own interaction with the U.S. labor market. Following is a summary of each of the programs in alphabetical order as they are listed in the immigration law.[3]

Students. Those with F-1 visas are admitted to pursue their education; that many of them wind up working in

---

David S. North is director of the Center for Labor and Migration Studies of the New TransCentury Foundation, Washington, D.C.

Exhibit 1. Labor market characteristics, fiscal 1978 admissions, and admission trends of selected classes of nonimmigrants

Class and visa symbol	Fiscal 1978 admissions	Characteristics
Students (F-1)	187,030	Only a minority work (at least legally); none are bonded to their employers; admissions of this group have increased in the 1970's.
Temporary workers of distinguished merit and ability (H-1)	16,838	All are workers, mostly in the professions; all are bonded to their employers; admissions have declined in the 1970's.
Other temporary workers (H-2)	22,832	All are workers, mostly in blue-collar occupations (including farmwork); all are bonded to their employers; admissions have declined in the 1970's.
Exchange visitors (J-1)	53,319	Most are workers, some are not; most are in the professions; some of the workers are bonded to their employers; admissions have been steady in the 1970's.
Intracompany transferees (L-1)	21,495	All are workers, mostly well-paid professionals and managers; all are bonded to their employers; admissions increased rapidly in the 1970's.

SOURCE: Admissions data from fiscal 1978 Annual Report, Immigration and Naturalization Service (forthcoming); characteristics from David S. North, *Nonimmigrant Workers in the U.S.: Current Trends and Future Implications* (Washington, New TransCentury Foundation, 1980).

the United States is an unintentional, but predictable, byproduct of their presence here. Although most F-1's attend 4-year colleges or graduate schools, many are admitted to attend grammar schools, high schools, and institutions where they are taught English and vocational subjects.

Students wishing to come to the United States must first find and be accepted by an educational institution authorized to admit foreign students by the Immigration and Naturalization Service. The school then issues a document (form I-20) to the student, which he or she then takes to a U.S. Consulate to apply for a visa. During the visa application process, the alien must satisfy the consular officer that he or she has enough money to get to and from the United States, to pay for the planned educational program, and to cover living expenses without working. Unless this assurance can be made, no visa is granted.

Should the student subsequently find that he or she needs additional funds and cannot secure those funds by working on campus (permission for which can be obtained from the college foreign student adviser), the student is required to seek a work permit from the Immigration Service. In fiscal 1979, for example, when nearly 190,000 F-1 students were admitted, 33,285 were granted permission to work and 5,364 were denied such permission. These data suggest either that most F-1 students do not need to work or that many work without permission.

F-1 students who work, either legally or illegally, are not bonded to their employers, as are most other nonimmigrant workers. They are free to move around the U.S. labor market, making their own arrangements and changing jobs as they choose. The nature of their work and the pay they receive is roughly comparable to that of U.S. students in the same situation, although their limited knowledge of English and of U.S. society is a handicap to some, and others presumably experience anti-alien discrimination.

Temporary workers of distinguished merit and ability. Those with H-1 visas are admitted because a U.S. employer filed a formal petition for their presence, the Immigration Service approved the petition (as it does in approximately 95 percent of the cases), and a consular official issued a visa to the nonimmigrant. These temporary workers are bonded to their employers, and include persons with extraordinary talents (leading opera singers, actors, and musicians) or exotic skills (jai alai players, French chefs). Sometimes entire companies (ice shows, symphony orchestras) arrive on a single H-1 petition, bringing their blue-collar support staff with them.[4]

A third subclass among the H-1's are members of the professions, admitted individually, but sometimes (as in the case of registered nurses) recruited in substantial numbers.

Other temporary workers. Those in the H-2 classification fill jobs for which the U.S. Department of Labor has certified that U.S. workers are not available. Most of them are assigned to less attractive jobs on the geographical fringes of the United States: dominating the construction industry in Guam, performing much of the blue-collar and service work in the Virgin Islands, cutting trees in western Maine and sugar cane in southern Florida, and herding sheep in remote pastures in the Mountain States.

The screening process for H–2 workers is more complex than that for any other group of nonimmigrant workers. First, the employer must satisfy the Labor Department that he has genuinely tried to secure resident workers (by offering them appropriate wages and working conditions), has failed in his recruiting efforts, and is thus qualified to hire alien workers (of his own choosing). Employers seeking to import H–2 workers are required to pay a special hourly wage, the adverse effect wage rate, to both their foreign and domestic workers. The 1980 special wage rates for the States using H–2 workers appear in table 1.

Applications for certification are often controversial —as they have been in the East Coast apple harvest, where congressional pressure exists to grant the certifications. (See table 2 for State-by-State certification of H–2's in the apple harvest.) In recent years, the courts have also intervened—generally requiring the certification of the nonimmigrant workers.

The potential H–2 employer, with a labor certification in hand, seeks approval of a petition from the Immigration Service and then secures either visas or visa-equivalents for the workers. He may hire any alien in the world he likes once he has the labor certification.

Exchange visitors. These nonimmigrants secure their J–1 visas in much the same way as students secure F–1 visas. The alien finds an exchange program sponsor approved by the International Communications Agency (an independent Federal agency), and then is admitted into that program by the sponsor, who issues an admissions certificate (like the foreign student's I–20 form). Having obtained a certificate, the exchange visitor may then seek a visa from a consular official.

Table 1. Minimum wage rates for H–2 workers, by State, 1980

States	1980 rates[1]
Arizona	$3.73
Colorado	3.79
Connecticut	3.32
Florida (sugar cane only)	4.09
Maine	3.43
Maryland	3.23
Massachusetts	3.30
New Hampshire	3.58
New York	3.18
Rhode Island	3.30
Texas	3.54
Vermont	3.53
Virginia	3.51
West Virginia	3.28

[1] Rates are based upon 1978–79 United States Department of Agriculture wage data and the formula published at 20 CFR §653.207(b) (1). Pursuant to 20 CFR §655.207(e), the employer must pay at least $3.35 per hour in calendar 1981. See 29 U.S.C. 206(a) (1).

Vermont	353	252	305	315	331
Virginia	978	621	922	1,036	1,141
West Virginia	524	377	601	572	744

[1] The number of jobs certified does not indicate the actual number of foreign workers admitted for such employment. An employer may choose not to use any or all of the certifications granted, and some foreign workers may work in two or more certified jobs.

[2] All certifications in 1977 were made pursuant to order from U.S. District Court at Roanoke, Virginia.

[3] In compliance with the order of the Fourth U.S. Circuit Court of Appeals in Richmond, Virginia, the Immigration Service admitted 414 more apple pickers than were certified in 1978. These are not included in the 1978 column.

SOURCE: Administrative reports of the Employment and Training Administration, U.S. Department of Labor.

Exchange visitors are an interesting, mixed lot. They include high school students living with American families, college and graduate school students, visiting professors, post-doctoral scholars, and foreign medical graduates performing their internships and residencies in U.S. hospitals.

Some of the J–1's study full time, others work. Some of those who work are bonded employees brought to the United States by a sponsor-employer.

Intracompany transferees. Those with L–1 visas are professionals and managers employed by multinational corporations, who have worked for their companies for at least 1 year and who have been screened through the same process as the H–1 visa holders.

Areas of controversy

Beyond the educational and diplomatic advantages of many of these programs, there are two major controversies surrounding the impact of nonimmigrant workers on U.S. labor markets. One concerns foreign-trained physicians and nurses, and the other involves various groups of farm laborers brought into the United States via the H–2 program.

Foreign health professionals. The issues regarding the foreign medical graduates and the foreign nursing graduates are similar. In both cases, groups representing the competing U.S. work force (such as the American Nurses Association and the American Association of Medical Colleges) contended that it was considerably easier for a foreign-trained health professional to qualify for a professional assignment in the United States than it was for one who is U.S.-trained, because of a less stringent prearrival competency examination (in the case of the foreign medical graduates) and a deferred examination (in the case of foreign nursing graduates). U.S. physicians and nurses contended that the quality of care provided by the alien workers was not up to U.S. standards. Although rarely mentioned in these arguments, rigorous admission standards for such workers could also tighten the labor market to the benefit of U.S. workers.

The foreign health care professionals admitted to the United States were numerous. During 1964–73, there were more admissions of foreign medical graduates than there were graduates of U.S. medical schools. The steady supply of foreign graduates eased the pressure to expand U.S. medical schools for years, thereby making it more difficult for U.S. blacks and others to secure places. One result of this combination of circumstances (the substantial numbers of foreign medical graduates and the level of support for U.S. medical schools) was that there were more Filipino medical graduates in the United States in 1975 than there were black ones. That balance has since changed; there are now more black than Filipino medical graduates.

Foreign nursing graduates were not as large a factor in the nursing labor force, but approximately one-fifth of the 432,000 increase in the size of the nursing work force during 1969–78 resulted from the admission of foreigners. Most of the foreign nursing graduates had trouble passing examinations (in English) required by the States. The nurses who failed the examinations were then forced to work as nurses aides or licensed practical nurses—an ironic development for nonimmigrants of "distinguished merit and ability."[5]

Eventually both resident work forces prevailed. During 1976–77, Congress and the Executive created tougher laws regarding physician admissions[6] and created a more rigorous competency examination for foreign medical graduates.[7] (Admissions of nonimmigrant medical graduates dropped sharply as a result, as table 3 indicates.) The reaction to the American nurses was less immediate: earlier this year, the Immigration Service promulgated regulations making passage of an examination in English, equivalent to those of the State boards of nursing examiners, a prerequisite to securing an H–1 visa as a registered nurse.[8]

Foreign farmworkers. The recurrent controversy about the farmworkers among the H–2's can only be summarized here. Some U.S. growers have maintained that domestic workers are not available at the wages set by the Department of Labor, and that alien workers are needed to prevent crop losses. Representatives of resident farm workers (such as the Migrant Legal Action Program, Inc.) contend that the growers actively prefer the hard working, docile Caribbean workers (largely from Jamaica) and sabotage efforts to recruit U.S. workers. They also point out that agricultural employers obtain, in effect, a 9-percent discount for hiring H–2's because they are not required to pay social security and unemployment insurance taxes for these workers.

What is rarely discussed is the remarkable power that employers of nonimmigrants have over their workers, particularly those in agriculture. H–2 employers have virtually unlimited power to hire and fire their workers. These employers can, and do, make the kind of highly selective hiring decisions that would be illegal outside the context of the H–2 program. Sugar cane employers of H–2's, for example, confine their hiring to English-speaking, black men (recruited in Jamaica and, to a lesser extent, in other former British colonies). They insist on young men (in a narrow age range) without a police record and in excellent physical condition. Because there are many more potential cane cutters than are needed, employers secure a remarkably elite work force; for the rates paid (around $3 an hour in the 1976–77 season), employers probably could not recruit such a work force in the United States. Further, because the H–2 farmworker is bonded to his employer, firing means not only that the worker has lost his opportunity to work at relatively high wages, but it also means his expulsion from the United States. If a Florida sugar cane grower is really annoyed with a worker, he may not only fire him, and expel him from the country, but

Table 3. Nonimmigrant physicians admitted to the United States, by class of admission, fiscal 1970–78

Nonimmigrant class	1970	1971	1972	1973	1974	1975	1976	1977	1978
Total	5,365	5,191	4,283	5,166	5,517	3,466	3,243	2,141	1,169

also blacklist him so that he never can work again as an H–2 farmworker.[9]

As if those powers are not enough to keep the work force in line, the H–2 employer has had additional help. In case of a strike, the Government has obligingly supplied replacements for the striking workers, on the grounds that the strikers have broken their contracts with the employers. However, regulations proposed by the Immigration Service in the spring of 1980, indicate that this practice may not continue.

Impacts on U.S. labor market

The findings in our study were that the labor-market role and impact of specific subsets of nonimmigrant workers vary widely and are strongly influenced by the conditions under which they entered the country. The impacts of the nonimmigrants on specific labor markets fall into three categories:

- The smallest impact is that of the accidental workers (all the F–1's and most J–1's); they generally do not cluster, and they come and go in the labor market with the freedom of immigrant workers; they are not tied to specific employers. Their impact is about the same as that of the addition of a similar number of U.S. workers of similar qualifications to the same labor market.
- The impact of those admitted individually to work (nonnurse H–1's, L–1's, some J–1's, and some nonrural H–2's) is mixed. In some instances, they fill genuine vacancies in the workplace, and thereby help the economy function more smoothly; in some cases they make the society more cosmopolitan, bringing to the United States exotic skills. In other cases, they may be (and here the argument grows complex and spirited) displacing resident workers or reducing training opportunities for such workers. This is particularly likely if there is a clustering of visiting alien workers.
- The impact of workers admitted in groups or as part of a mass-hiring operation is clear. (These are the rural H–2's, the H–1 nurses, and some of the other H–2's.) Such workers tend to "freeze" the micro-labor markets where they cluster: labor intensive work patterns (such as the hand cutting of sugar cane in Florida) are preserved, and wages do not rise as they might otherwise.

There will continue to be, and there should be, for nonlabor-market reasons, a continued flow of immigrants and nonimmigrants to the United States; that is an important part of our heritage. It is another matter, however, whether part of the nonimmigrant stream should provide bonded workers as a subsidy to a small number of U.S. employers. ☐

Employment patterns of Southeast Asian refugees

Based on the limited data available, most earlier Indochinese refugees found jobs, have had gradual income gains, but work long hours; recent arrivals speak less English and face more employment problems because of economic conditions

ROBERT L. BACH AND JENNIFER B. BACH

The extraordinary exodus for Vietnam, Laos, and Kampuchea (Cambodia) has brought more than 360,000 refugee settlers to the United States beginning in 1975. Recent arrivals have greatly swollen the numbers. Based on President Carter's June 1979 commitment to admit 14,000 a month, 168,000 Southeast Asian refugees will have entered the United States during fiscal year 1980.[1]

The Refugee Act of 1980[2] was designed primarily to meet the needs of those fleeing political and economic uncertainties as well as military conflicts in Southeast Asia. The new law concluded a long history to temporary, ad hoc legislation (see the box, p. 41) by establishing a permanent and systematic method[3] for accepting refugees into the United States and assuring their effective resettlement. Thus, a major goal of the act is the swift and complete integration of the Indochinese refugees into the "mainstream" of American life. Principally, this involves locating and obtaining adequate employment.

Congress sought to assist the refugees in their employment search. Under the 1980 law, it required the Office of Refugee Resettlement to provide resources for employment and training and job placement.[4] Congress also provided monetary assistance for up to 3 years—expecting all to be working and economically self-sufficient by then.

Some have questioned whether, within 3 years, the Southeast Asian refugees will gain a level of labor force participation, employment, and income to warrant the label "self-sufficient." However, based on our evaluation of all available data, there is sufficient cause for optimism. The vast majority of refugees have actively joined the U.S. labor force and found jobs relatively quickly. Differences among men and women are substantial in some areas, but these largely reflect similar patterns in the U.S. population. Cultural differences among the three Indochinese nationalities are certainly distinguishable, yet their employment levels are surprisingly similar. And, by far the most promising indicator, both labor force participation and employment evidently increase with each year of residence in the United States.

Still, there are signs that urge caution. Refugees tend

Robert L. Bach is assistant professor of sociology, State University of New York, Binghamton. Jennifer B. Bach is a private research analyst.

to work longer hours than U.S. workers, while many remain dependent on government subsidies. Significant regional disparities also argue against generalized optimism. Already, for example, an uneven geographical distribution of refugees within the United States has generated concern and controversy, not only because it implies a concentrated and differential impact on local government resources, but because it affects newer refugees' employment opportunities. And, a growing concern is apparent over the characteristics of the recent arrivals and their prospects for employment.

Data on refugees

Our analysis of the employment status of Indochinese refugees presented in this article is based on the two major sources of refugee information available: surveys conducted by Opportunity Systems, Inc., for the Department of Health and Human Services and the annual Alien Address Registration conducted by the Immigration and Naturalization Service. Each provides data on overall employment and demographic differentials, although coverage of the refugee population is quite different, and comparisons are more suggestive than precise.

Opportunity Systems, Inc., conducts a series of telephone surveys that cover a cross section of all Southeast Asian refugees who arrived through December 1977. The sample selects from the 1975 Evacuee Master File and from those admitted under the various temporary programs: the Humanitarian Program (January–May, 1976), the Expanded Parole Program (May–December, 1976), and the 1977 Indochinese Parole Program (August–December).

The most recent available survey, taken during April–June 1979 by Opportunity Systems, and reported in the 13th *Report to Congress,*[5] included 356 Vietnamese, 175 Cambodian, and 185 Laotian heads of households. These households contained a total of 3,539 persons, or an average of 4.94 per household. Response rates appear to be a recurring problem for the Opportunity Systems surveys, as one might expect from the general difficulty with locating and interviewing immigrants after they enter the United States. For the April–June survey, 716 of an original 1,000 were interviewed successfully, yielding a response rate of only 71.6 percent.

Under the Alien Address Registration, aliens are required by law to register each January with the Immigration and Naturalization Service. They file a postcard form that lists name, address, alien identification number, date of birth, date of entry, and type of visa. In addition, they are to report their employment status and place of employment. Although coverage is typically a problem, Linda Gordon and Stephen Schroffel[6] estimate conservatively that between 85 to 90 percent of the Southeast Asian refugee population registered from 1976 to 1979. The 1979 registration included 157,509 persons of Vietnamese, Cambodian, or Laotian nationality; about 87 percent of all those admitted to that date.

The Immigration Service data reported here are derived from a 6.8-percent sample, a total of 10,629 persons.[7] A 10-percent subsample provides information on industry and occupation.

Unfortunately, the employment information from these sources is not directly comparable. Unlike the Opportunity Systems surveys, the alien registration data do not distinguish between those who are out of work but looking for a job ("in the labor force" but unemployed) and those out of work and not searching ("out of the labor force"). Consequently, the Immigration Service data measure only the proportion of refugees who report holding a job at the time of registration. This proportion of refugees employed can be compared, however, with the employment population ratio routinely reported for the U.S. population.[8] Moreover, a profile of the refugee experience can be constructed by examining several labor market indicators estimated from each source.

Brief reference will also be made to a study conducted by the Office of the Inspector General, U.S. Department of Health and Human Services.[9] The study was designed to assess the resettlement effort by gathering qualitative information from open-ended discussions with 900 people, including 500 refugees and 335 workers from local communities and voluntary agencies. Although not statistically valid samples, the observations reported will be used here to help fill out an otherwise skeletal profile of the resettlement experience.[10]

With the Refugee Act of 1980, Congress anticipated the need for comprehensive and current statistical information to help monitor the resettlement efforts. Thus, the law requires the Secretary of Health and Human Services to develop a reporting capability that will provide Congress an updated profile of the refugees' employment and labor force characteristics, a description of their geographical location, and an account of the activities and policies of the Office of Refugee Resettlement, the voluntary agencies, and those groups and individuals sponsoring refugees. Such a reporting capability is essential because many of the government's existing information systems do not identify refugees as a separate group for reporting purposes.[11]

Labor force activity

An employment profile of the Indochinese refugees can be sketched by reviewing several indicators of labor market activity.

As shown in the following tabulation, employment-population ratios for the Southeast Asian refugees indicate that approximately 54 percent were employed:

Population	*Employment-population ratio*		
	Total	*Men*	*Women*
U.S. civilian	58.9	72.6	46.6
Refugee:			
Immigration Service	53.3	62.6	42.6
Opportunity Systems, Inc.	54.4	67.7	37.7

The independent estimates are remarkably close, considering the Opportunity Systems survey (April–June 1979) includes only the pre-1978 arrivals, while the Immigration Service registration (January 1979) includes those admitted later. The 54 percent employment ratio for refugees, however, is smaller than the proportion of the U.S. population employed during January 1979.

It is of some importance that the sex differential is similar in both the refugee and U.S. populations. Female employment has been and will likely continue to be a significant factor in raising household incomes for refugees and, thus, in contributing to more rapid resettlement.

These differences in employment ratios are influenced, of course, by both the rate of labor force participation and the unemployment rate. As mentioned previously, the Immigration and Naturalization Service registration data do not permit this essential refinement. However, the comparison of the Opportunity Systems data and U.S. labor force measures helps account for the employment ratio differential.

Opportunity Systems estimates of refugee labor force participation and unemployment rates and the comparable U.S. labor force data are shown in the following tabulation:

Measure	*Population*	
	U.S.	*Refugee*
Labor force participation rate		
Men	78.2	70.3
Women	50.2	39.3
Unemployment		
Men	4.9	3.6
Women	7.0	3.5

Clearly, much of the above difference in employment ratios results from the significantly lower rates of labor force participation among the refugees; the difference is essentially the same for both sexes. Comparison of unemployment rates strengthens this conclusion. Once a refugee has entered the labor force, he or she is more likely to have found a job than a U.S. worker. In addition, the importance of female employment among refugees is again highlighted: whereas women in the U.S. labor force are much more likely than men to be unemployed, female and male refugees share similar low rates of unemployment.

Consequently, these data suggest that the lower overall level of employment in the refugee population results from a lower rate of labor force participation, rather than a greater inability to find employment once searching has begun. Of course, this merely leaves another question: why do refugees have lower labor force participation rates?

The primary answer seems to be that refugees are taking advantage of available educational and training opportunities. Data collected by Opportunity Systems show that 59.8 percent of those interviewed gave school attendance as one of the principal reasons for not searching for a job. Homemaking was mentioned by 26.1 percent; poor English (21.2 percent) and poor health (17.6 percent) were also listed frequently.

The Government interview data[12] corroborates that both training and health affect refugees' labor market behavior. The Inspector General reported that 35 percent of those interviewed cited their inadequate knowledge of English as a major reason for not being employed. Another 19 percent gave health as a contributing factor. The report also noted that, although 41 percent of those interviewed took jobs immediately upon arrival, only 9 percent would advise others to do so. It seems many refugees view training, especially language training, as essential to securing better employment opportunities over the long run.

Such a perspective, if held throughout the refugee population, could substantially affect participation and employment rates in the short run because many of the newer arrivals are sponsored by earlier entries and would receive their advice. In addition, the presence of new government programs, resulting from the provisions of the Refugee Act of 1980, could allow more of the new arrivals to take advantage of training opportunities.

Over the long run, however, the refugees will likely approach levels of labor force activity comparable to the U.S. population. Table 1 demonstrates this with data from both the alien registration and the Opportunity Systems surveys.

The data in columns 1 and 2 of table 1 show that, for those entering before January 1978, each additional year of residence increased the likelihood of employment by an average of about 6 percentage points. The 1975 arrivals are of particular interest because most are eligible for and will become U.S. citizens in 1980. As of January 1979, after 4 years of residence, both men and women have reached virtually the same employment ratio as the U.S. population: 70 percent of male refugees were employed compared to 72.6 percent of U.S. men; 46.1 percent of the female refugees and 46.6 percent of U.S. women were employed.

The Opportunity Systems estimates of refugee labor force participation parallel the above employment counts. Again, each successive year in the United States shows refugees participating at a higher rate. Nevertheless, their participation is still below the overall U.S.

level, with 1975 male refugees about 9 percentage points below their U.S. counterparts.

More recent arrivals

Arrivals within the year preceding the January 1979 alien registration have a rather low employment ratio. This could result merely from their new exposure to the United States. However, such an assumption is unwarranted. There is general agreement, although little documentation, that Southeast Asian refugees arriving before 1978 were positively selected; that is, they had higher educational and occupational status backgrounds in Asia and a greater knowledge of English. For example, a General Accounting Office review of the resettlement program[13] reported that more recent arrivals are "poorer, less able to speak English, and less exposed to urban life than the earlier wave of refugees."

The National Governor's Association holds a similar view, reporting to its members that[14]

> refugees who arrived after 1978 faced even greater problems of adjustment and employment. They are comparatively less educated, and have fewer marketable skills and poor language ability. In contrast to the earlier refugees who immediately accepted entry-level employment, this second group showed an increasing reliance on cash and medical assistance.

Consequently the lower employment ratios and labor force participation rates of newer arrivals may be caused by either differential time in the United States, lesser background skills, or even divergent opportunities in areas of resettlement. This question remains largely unexplored, however, because a proper research design would require observations of the same individuals over time; a longitudinal study for which there has been only limited time and resources.

Still, a few tentative observations are available. Table 2 shows the 1979 income distribution for refugees entering in 1975, 1976 and 1977. In addition, it includes the 1978 income distribution of the cohort arriving in 1975. The April–June 1979 survey data for the three cohorts support the claim developed in table 1 that the longer a refugee resides in the United States, the higher his or her income. Without additional evidence, this conclusion (as noted) is wrought with inference problems. However, the November–December 1978 survey data show that, as the 1975 cohort remained an additional 6 months in the United States, its income distribution shifted upward. This more accurately shows that length of U.S. residence facilitates reaching higher employment and income levels.

Table 1. U.S. labor market activity in 1979 of Southeast Asian refugees by year of entry and sex, persons age 16 and over

Year of entry	Employment ratio (Immigration Service)		Labor force participation (Opportunity Systems, Inc.)	
	Men	Women	Men	Women
Pre-1975	74.1	54.2	....	....
1975	70.0	46.1	69.1	42.9
1976	64.2	36.2	65.5	34.4
1977	58.8	41.0	58.4	29.6
1978	33.5	19.0	....	....
1979	13.8	28.6	....	....

Table 2. Monthly income for Southeast Asian refugees, by year of entry, persons age 16 and over

Monthly income	1978 distribution[1] of refugees who entered in 1975	1979 distribution[2] of refugees who entered in		
		1975	1976	1977
Less than $200	2.1	2.7	3.3	4.6
$200 to 399	3.1	3.6	4.1	5.6
$400 to 599	7.6	4.4	6.2	15.8
$600 to 799	14.7	11.6	15.7	12.4
$800 or more	70.0	77.6	70.2	60.8
Unknown	2.5	.0	.5	.8

SOURCE: Opportunity Systems, Inc., *Seventh Wave Report: Indochinese Resettlement Operational Feedback*, July 10, 1979.

Table 2 also reveals that the majority of refugees with jobs receive $800 or more per month. This is certainly a promising sign. Nevertheless, it is important to note that to earn this monthly income, the refugees were working significantly longer hours than the U.S. labor force. For instance, the 13th Health, Education and Welfare, *Report to Congress*, stated that, compared to 58.7 percent of the U.S. labor force working 40 hours or more per week, at least 85 percent of the refugees labored this long.

The longer workweek, and indications that about a third of all the refugees receive cash assistance, suggests that even the relatively comparable employment levels may not be enough for the refugees to achieve "self-sufficiency." Still, there is reason to maintain a guarded optimism.

Occupational profile

What jobs have Indochinese refugees found? Table 3 presents two independent estimates and compares them to the U.S. labor force in January 1979. At this writing, table 3 represents the most recent occupational profile available for the Southeast Asian refugees. Still, one must remember that many refugees, suspected of possessing substantially different occupational traits, have entered since these data were collected. The current occupational profile may look very different.

Immigration's alien registration, covering all those who entered up to 1979, classifies about one-third of the refugees as white-collar workers. This is about 20 percentage points below the white-collar share of the U.S. workforce. In addition, the largest white-collar category of U.S. workers, about a quarter, held clerical and sales jobs; both Immigration and Opportunity Systems data report that only 13 percent of the refugees worked at such jobs. However, 22.1 percent of the refugees reporting to Immigration were service workers, which compares to only 13.3 percent of U.S. workers.

Overall, then, the occupational profiles of the two populations seem reasonably similar. Even the lower proportion of refugees in white-collar jobs may result from the inclusion of new arrivals in the Immigration data. Previous research, for example, has shown that new arrivals experience a substantial downward mobility from their occupational status in the country of origin. It takes a number of years to regain even a share of that initial decline.[15]

A diverse population

Nationality may also be another source of variability in the employment experience of these refugees. The term "Southeast Asian" obscures many essential differences among those from Vietnam, Cambodia, or Laos: differences include language, religion, culture, occupational histories, and family composition. Even within each nationality, diverse ethnic groups condition the refugees' behavior in sharply distinct ways: the Hmong from Laos and the ethnic Chinese from Vietnam are just two important examples. Therefore, nationality differences among labor market indicators should be considered mere approximations, preliminary introductions, to more complex determinants of these refugees' work experiences.

Some insight into the diversity of the refugee population is gained by contrasting the 1979 employment-population ratio (age 16 and over) for each nationality,[16] as shown in the following tabulation:

Nationality	*Employment ratio*	*Sample size*
Total	53.2	6,741
Vietnamese	54.7	5,852
Cambodian	55.7	255
Laotian	38.5	634

Vietnamese and Cambodian refugees have very similar shares of their population employed. The Laotian group, however, reports a much lower share. Because the Laotian subgroup is dominated by the Hmong, a mountain tribal people, this lower employment level may not be surprising. This difference can be explained simply by the age, sex, and arrival date of the Laotians. That is, when one controls statistically for the variation in employment caused by these demographic factors, virtually no difference remains in the employment ratios for these groups.[17]

Favored destinations

Federal policy toward the distribution of refugees has aimed at their wide dispersal.[18] In spite of this, the refugees continue to concentrate in several States and counties; either because of the emphasis on family reunification and sponsorship, or because of secondary migration (after initial resettlement) toward ethnic enclaves.

Table 4 shows the proportion of refugees in several States from 1976 to 1979. The clearest and most important observation from these data is the increasing concentration in both California and Texas. In 1976, both States shared 30.8 percent of the total refugee population; by 1979, they held 43.3 percent. These figures, of course, precede the increased numbers arriving in 1979. Yet, State Department information on place of intended resettlement for those arriving in 1979 indicates that the impact of these newer arrivals on the two States may be greater: California is receiving about 4 of every 10 new arrivals, and Texas about 1 in 10.[19]

In addition to the disproportionate share of new arrivals, there is general agreement that California and Texas gain refugees through secondary migration. For instance, David North[20] has shown, using data from the 1978 alien registration, that there was a strong net migration to California, Texas, Louisiana, and Virginia. The shift was occasioned, of course, by a reduction in some States: Maine, the Dakotas, and Hawaii. The interstate shift also corresponded with an increased concentration in urban areas.

Table 4 also provides an important implication of this uneven geographical distribution. Matched with the proportion of the total refugee population in each State is the corresponding employment ratio for refugees reporting in January 1979. The first observation of significance is that California, with the largest share of refugees, has the lowest employment ratio among the States listed. However, Texas, the second most popular State for these refugees, has the highest ratio. In each case,

Table 3. Occupational distribution for Southeast Asian refugees and U.S. population, persons age 16 and over

Occupation	U.S. workforce, January 1979	Refugees	
		January 1979 [1]	April - June 1979 [2]
White collar			
Total	51.2	32.2	51.8
Professional and technical workers	15.8	16.1	17.7
Managers and administrators	10.9	2.2	21.1
Clerical and sales workers	24.5	13.9	13.0
Blue collar			
Total	48.8	67.8	48.2
Craftworkers	13.2	12.7	22.5
Operatives and transport workers	15.4	24.3	9.7
Farm managers	1.4	.0	.8
Laborers, farm and nonfarm	5.5	8.7	9.5
Serviceworkers	13.3	22.1	5.7

the refugee employment ratio differs from the U.S. population by a significant amount; much lower for California and higher for Texas. The remaining States, with the exception of Louisiana, have employment levels comparable to the total U.S. figure.

The reason for these vast differences between California and Texas is not clear. However, even when the demographic composition of the refugees in each State is accounted for statistically (that is, age, sex, year of entry, and nationality), the chance of a refugee having found work is still significantly greater in Texas than in California.[21]

One possible contributing factor is that California may suffer from a disproportionate influx of secondary migrants who are not employed. This secondary migration effect has not been studied extensively outside its immediate impact on the number of refugees in an area. Even then, the focus is net migration. Consequently, table 5 provides a rare portrait of the demographic characteristics and employment of secondary migrants.

Secondary migration: Los Angeles

The data presented in table 5 derive from the 1978 and 1979 alien registrations and pertain only to Los Angeles. As such, they do not permit a comparison with the Texas experience. Nevertheless, they do explore the assumptions about the difference in a preliminary fashion. Los Angeles forms an important part of the southern California region that attracts a substantial number of secondary migrants. If secondary migrants have a lower employment level there, it becomes more likely that the surrounding areas will have had similar experiences.

The data are part of a 4-percent, systematic random sample of Southeast Asian refugees registering with the Immigration Service in January 1979, who reported their current address as Los Angeles. To determine their residential status, each respondent was checked for his or her address 1 year previously, in January 1978. Migrants, consequently, are defined as those moving to Los Angeles during 1978.

Table 4. Proportion of all Southeast Asian refugees residing in selected States, 1976–79, and their 1979 employment-population ratio

[In percent]

State	Proportion of all Southeast Asian refugees				1979 employment population ratio (age 16 and over)	
	1976	1977	1978	1979	Percent	Rank
California	22.5	24.3	27.8	31.2	46.1	7
Texas	8.3	8.5	9.2	10.1	63.5	1
Pennsylvania	6.0	4.9	4.5	4.2	53.2	5
Louisiana	2.9	4.2	4.5	4.1	62.5	2
Virginia	4.3	4.3	4.3	3.8	55.9	3
Washington	3.8	3.6	3.6	3.6	50.0	6
Illinois	3.2	2.8	2.8	3.0	54.6	4

Table 5. The distribution (all ages) and employment-population ratio (ages 16 and over) of Southeast Asian refugees in Los Angeles, by residential status, 1978–79

Residential status	Distribution		Employment-population ratio	
	Percent	Number measured[1]	Percent	Number measured
Total	100.0	183	47.6	124
Stayer	50.8	93	55.1	69
New entry	23.0	42	29.2	24
Mover	11.5	21	60.0	10
Migrant:				
Within California	6.0	11	38.1	21
Outside California	8.7	16		

[1] Twenty persons were excluded as missing.

The sample shows that 5,902 Southeast Asian refugees lived within the Los Angeles city limits, or about 39.2 percent of the county's total. Most of the city's refugees were Vietnamese and were under age 25. Over half (59.7 percent) entered the United States in 1975, with an additional 21.8 percent arriving in 1978.

For the distribution of respondents by residential status, "stayers" are those who lived at the same address in January of both 1978 and 1979; "new entries" registered in 1979 reported their date of entry as 1978 and could not be located on the 1978 registration list; and, "movers" are persons living in Los Angeles for both registration dates, but reporting different addresses. Migrants moved into Los Angeles during 1978 from either another city in California or from another State. Ten percent of the sample registered in 1979 reported their date of entry as before 1978, but did not file with the Immigration Service in 1978. These are considered "missing" and have been excluded from this part of the analysis.

The data show that Los Angeles gains, at least, an additional 14.7 percent of its refugee population from secondary migration. Of course, it also loses some, which is not indicated here. Only about half of these migrants, however, originated outside the State.

The proportion of new arrivals in the city is of much greater significance than secondary migrants. Almost a quarter of all registered refugees in Los Angeles entered the United States during 1978, far exceeding the proportion of the national total that arrived in that same year.

In addition to this numerical impact, new arrivals also had a significantly lower employment ratio than any of the other three residential groups. New arrivals are only half as likely to be employed as those who have moved within Los Angeles, possibly to find employment, and are almost 10 percentage points less likely than secondary migrants (table 5).

The data also support, however, the argument that secondary migrants contribute to lower employment levels. These migrants are about 30 percent less likely to be employed than persons remaining residentially stable in Los Angeles. Still, there is reason to believe that this negative employment impact may be short-lived. Secondary migrants, more so than those living in Los Angeles during the whole year, tend to be men and have few additional persons listed at their address.[22] A reasonable hypothesis would be that, because these migrants have characteristics normally associated with higher employment levels, their continued residence in Los Angeles during the following year would result in substantial employment gains.

Settling old and new issues

Any evaluation of the employment records of the refugees must consider a fundamental point: refugees are not admitted to the United States to perform a special labor supply function. Their import is intended neither to fill temporary gaps in particular corners of the labor market nor to ease a shortage of domestic workers. The Refugee Act of 1980 refers only to accepting those of "special humanitarian concern." As a result, Southeast Asian refugees do not have any advantage that would allow them to displace domestic workers. In fact, the special aid programs made available by the new law are designed to overcome inherent disadvantages, those likely to prohibit refugees from entering the labor market on any terms. Medical assistance, for example, provides a necessary remedy to the effects of long periods in holding camps, to the lingering and devastating consequences of malnutrition, and to the damaging results of open-seas flights.

It is also worth noting that many of the programs open to refugees, as well as much of the interest in research on refugees, is necessary to protect them from unfair labor practices. Inability to speak English, long work hours, inadequate income, and elementary fears of not being self-supporting are precisely the conditions that would permit refugees to be exploited in the labor market—to the detriment of both themselves and U.S. workers. It is important, therefore, that U.S. trade unions continue to support the goals of the resettlement program, and that refugees participate in available training programs.

Of course, it is also essential to recognize that, unlike many previous groups, these refugees enter an American economy strained by double-digit inflation and rising unemployment. In this context, Federal, State, and local governments are less able to provide assistance than in more prosperous times. In their place, the "private sector," primarily the voluntary agencies and the refugee sponsors, has been assigned the major role in the entire process.

Any future attempt to review the employment-related activities of the resettlement experience, therefore, needs to take account of the whole range of related activities. This should involve conducting and reviewing research in at least three major areas.

First, there is a need to generate data on participation and employment that represent the entire refugee population, are more comparable to standard labor statistics on the U.S. population, and can be made available more quickly than existing reports. In the tradition of the present descriptive exercise, this information—and the analysis it generates—would serve as a national accounts system, measuring how many and who passed through specific sectors of the American economy. It is this type of information Congress seeks through the Refugee Act to gauge how smoothly resettlement progresses.

Although essential for labor market analysis, such inquiries stop short of precisely those questions of particular importance to the refugee program. For example, how and to what extent do the following influence the participation of refugees in the labor market: voluntary agencies, ethnic enclaves, government programs, and community reception.

These issues require a series of more detailed studies which would be conducted at the local level and produce new data. Perhaps the key issue for these studies is the role of ethnic communities in conditioning the participation of refugees in particular sectors of the labor market and in specific training programs. Included within this area of investigation are questions such as: how important will refugee owned, operated, and staffed small businesses become as a means of generating employment for successive waves of arrivals? Is poor English as important to labor force participation where a receptive ethnic enclave can employ the newcomer? And, will the presence of these communities counterbalance the presumed negative effect of the lower status backgrounds of the latest arrivals?

The third area of research focuses specifically on the various programs and services available, and unavailable, to refugees. The key emphasis here should be on the varying philosophies and services of the private voluntary agencies. Indeed, so much of the responsibility for resettlement has been given to this sector, that one would anticipate an outpouring of comparative research projects. Yet, as of this writing, no such studies are underway.[23]

Government programs will be studied more completely as part of the normal evaluation process. Such studies usually examine the internal structure of existing or alternative services and their differential outcomes, hopefully including labor market outcomes after several years. Efforts to make these studies more comparative

(that is, contrasting them to programs in various areas of the country), would be a useful step. Integrating these studies with the research on the role of the voluntary agency and ethnic community should also be encouraged.

Finally, there is a serious lack of understanding of how the refugees view themselves in the resettlement process. Throughout the United States, new communities are emerging, undoubtedly with their own unique perspective on their experiences and future opportunities. These perceptions need to be uncovered, studied, and their messages understood. ☐

FOOTNOTES

[1] Southeast Asians represent 72 percent of the 230,700 refugees and asylum cases sought by the Administration in fiscal year 1980. Overall, the Administration planned to accept 169,200 from Asia, 33,000 from the Soviet Union, 17,000 from Latin America, 5,000 from Eastern Europe, 2,500 from the Middle East, 1,500 from Africa, and 2,500 asylum cases.

[2] Public law 96-212, signed into law Mar. 17, 1980.

[3] The refugee act requires the President to request the number of refugees over 50,000 to be admitted each fiscal year before that year begins and after consultation with Congress. Because the act passed in the middle of fiscal year 1980, the Administration requested and received an extension of the present rate of admission for Indochinese refugees (14,000 monthly).

[7] The total sample size differs slightly from that reported by Gordon and Schroffel, *op. cit.,* because of the method used to identify Southeast Asian refugees.

[8] The comparison assumes that few refugees have been institutionalized since arrival.

[9] "Indochinese Refugee Assessment," Secretarial Report, U.S. Department of Health and Human Services, Sept. 28, 1979.

[10] It should also be remembered that this study took place before the passage of the Refugee Act of 1980. Thus, many of its conclusions may reflect the uncertain budgetary circumstances under which the resettlement program worked for several years.

[11] Recently, the Office of Management and Budget turned down a request from the Department of Labor to change the Employment Service reporting form to identify refugees. As a consequence, it will be extremely difficult to determine whether refugees who are not enrolled in other job training or placement services, but receiving cash assistance, are complying with the law and registering with the Service. In addition, the Secretary of Labor, who has to report to the Coordinator for Refugee Affairs on the steps taken to increase refugee participation in the Department's programs, will not be able to report on their level of Employment Service use.

The new Cuban immigrants: their background and prospects

Samples from immigration data show that most early arrivals were young working-age men, that education and skill levels are above average for Cuba, and that the number of ex-offenders is significant but includes many jailed for political reasons

ROBERT L. BACH

In mid-April 1980, the Cuban government, by announcing it had withdrawn "protection from the Florida corridor," triggered the flight of more than 123,000 new Cuban refugees to the United States. This might have been merely the latest addition to the exodus that began in 1959, except that from the outset neither the Cuban nor U.S. governments had control over the character or volume of the immigrants. Cuban President Fidel Castro had evidently underestimated the response to the advertised opportunity to leave. And the U.S. tradition of accepting Cuban refugees with open arms was suddenly strained by the potential burden of unknown numbers of new immigrants landing in south Florida.

Much of the confusion and bewilderment that caught reporters' eyes and overwhelmed some local officials resulted from the international political dilemma and, specifically, the Carter Administration's delay in declaring a legal status for the Cubans. The Administration faced a tough policy question. The historical open-door policy for Cuban immigrants and the Cuban-American community's expectations that this group would be treated the same argued for accepting them quickly and giving them full "refugee status" under the Refugee Act of 1980. Foreign policy reinforced this view: once again, here was a demonstration of the failure of the Castro government.

Yet the Administration was wary not to create in haste an unwarranted precedent. Unlike the previous flows, this one lacked order and due process, making it impossible to screen undesirables before their departure from Cuba.[1] There was also the possibility that to embrace these migrants as refugees would open the Florida coast to an onslaught of Caribbean poor. Fifteen thousand Haitian "boat people" in Miami were enough to give substance to that concern.

But clearly the most troublesome issue was the cost of resettlement. In a period of fiscal restraint and recession, President Carter decided not to grant the Cubans the generous benefits of refugee status (for example, 100 percent Federal reimbursement of refugee assistance costs). Instead, in late June, the Administration announced that the newcomers would be treated as applicants for asylum, and that special legislation would be sought to resolve both the Cuban and Haitian legal status issue. As a result, Cubans who arrived between April 21 and June 19 (and all Haitians processed by the Immigration and Naturalization Service before June 19) had their parole status extended for 6 months.[2]

This solution was fashioned in the face of a tough political reality; in part, the consequence of an anti-immigration public sentiment characteristic of bad economic times. A Columbia Broadcasting System-*New York Times* poll, for example, found that almost half of those sampled nationwide opposed admitting more Cubans. Lack of jobs was a primary reason. The State Department received calls and telegrams that ran heavily against the boatlift, and Senator Lawton Chiles (Demo-

Robert L. Bach is assistant professor of sociology, State University of New York, Binghamton.

crat-Florida) reported an 80 percent negative constituent response.[3]

Some responsibility for this public mood must lie with the public characterization of these Cubans. *Granma*, the Cuban Communist party newspaper, charged that those who left were "social dregs," "delinquents," and "scum." "Lumpen," short for lumpenproletariat, became the standard phrase for the new refugees. Many reports in U.S. newspapers echoed the theme, focusing attention on the number of "social undesirables": prisoners, the disabled, mental patients, and others.

Compared to the "Golden Exile" of the 1960's, when wealthy businessmen, professionals, and managers migrated *en masse*, this latest wave of Cubans fared poorly. But how poorly? Did the disorganization of their flight or the current political climate unfairly color our impressions? Based on an analysis of data collected by the Immigration Service during processing, the new arrivals were neither the "upper-crust" nor the bottom layer of Cuban society. They generally possess education and skill levels above the average for those remaining in Cuba and about the same as those who arrived in the 1970's. The sample data examined in the following sections were based on Immigration Service files from two processing centers in Miami and from Eglin Air Force Base, where later (and allegedly less desirable) refugees were processed.

The Miami profile

The registration records of the Cuban Refugee Emergency Center in Coral Gables represent a good starting point. President Eisenhower established the center in 1960 to process the first wave of Cuban immigrants, and President Kennedy expanded the resettlement program (and its facilities) 1 year later. Thus the Center was the logical place to receive this latest group.

The center registered nearly 2,000 of the first to reach Miami. But, as the influx accelerated and processing responsibility passed to the Federal Emergency Management Agency,[4] processing operations moved to Tamiami Park and, subsequently, to Opa Locke Airport in North Miami. President Carter later opened another processing center in Florida (Eglin Air Force Base), followed by the use of military bases in Arkansas, Pennsylvania, and Wisconsin.

I extracted from the Center's registration records a 50 percent systematic random sample, including information on age, sex, education, and occupation. There were 1,937 records in all, and each person had arrived before April 29. A 10-percent subsample included additional information on marital status, knowledge of English, last place of residence in Cuba, and relatives and friends in the United States.

Because these registrations represented only the earliest arrivals, biographical data forms for 633 persons processed at Opa Locke Airport also were examined. These were later arrivals, between May 9 and 13. The Immigration Service prepares these forms only for persons 14 years old and over. Given the pace of processing at the airport, only 10 percent of these records could be used, thus yielding a rather small sample size. Nevertheless, the two samples taken together provide a clear profile of those arriving in the Miami area.[5]

Most of the early arrivals had jumped the gates of the Peruvian Embassy in Havana, thus initiating this latest flight. They were older than those processed at Opa Locke and less likely to have relatives or friends already in the United States. There were also more men in this first group and fewer who were married. But these differences are inconsequential compared to the overall profile. The majority from both samples were working-age men, many came with families, and over 70 percent had relatives or friends awaiting them.

Additional information available only for the earliest arrivals (Coral Gables) indicated that 90 percent had been residing in the province of Havana. Most lived in the capital city. Almost no one (5 percent) could speak or understand English, even though their average years of schooling in Cuba was about the same as earlier Cuban refugees who could. Their 9 years of school, on average, was much lower than the Cuban refugees leaving in the early 1960's, but similar to those arriving in the 1970's.

From a labor force point of view, it is difficult to see how those arriving in Coral Gables could be called "social dregs," "undesirables," or "lumpenproletariet." Only one person sampled among the earliest arrivals was unemployed prior to arrival and only 18 percent would be considered "out of the labor force" by U.S. labor force classifications: 11 percent reported they were students, 6 percent were homemakers, 10 persons were retired, and two were in the military. Nor were many of the arrivals "marginally employed." By U.S. labor force classifications, the majority at Coral Gables were solidly employed: craftworkers, factory laborers, equipment operators, and professionals or technicians. This included mechanics, plumbers, crane and large-equipment operators, carpenters, and masons. Twenty percent of the professionals were teachers and, of those sampled, there were physicians, nurses, professors, accountants, and computer operators. Evidently, many skilled workers were among the first to accept the offer to leave.

The Cubans arriving later and registering at Opa Locke reported fewer skilled jobs. There were fewer professionals, more bus, taxi, and truck drivers, and far more service workers. Yet the greatest difference was the proportion who neither held nor sought a job. The Cubans processed at Opa Locke were nearly twice as likely (32 percent) as the earlier group to be homemakers, students, or retired.

The immigrants in both samples generally had occupational experiences in Cuba that are remarkably similar to the types of jobs most likely obtainable in the Miami economy.[6] This is, as an aside, unlike other groups of recent refugees resettled in the United States, who reportedly lack urban industrial skills.

Skeptics, however, will and should object to the conclusions drawn from these samples. There are at least two reasons why those processed in Miami may be more highly skilled and better educated than most other 1980 arrivals. First, if Castro did empty jails and mental hospitals when the flow was greatest, as the allegations run, these "undesirables" would have arrived later than the period covered by these samples. They also would be more likely to have been processed at a military base. In addition, Federal officials decided early in the processing operations at Key West to send family groups to Miami and single men and women elsewhere. The larger share of families in the sample from Opa Locke, compared to those registered at the emergency center, is a consequence of this decision.

To check on these probable biases, I examined the Immigration Service biographical data forms for the Cubans processed at Eglin Air Force Base. This represents the first step of a project to document the background characteristics of the approximate 123,000 Cubans who arrived since April 20, 1980. The project is being carried out with the cooperation of the Office of the U.S. Coordinator for Refugee Affairs, the Immigra-

History of U.S. immigration law

Until 1965, U.S. permanent immigration law made no explicit provision for the refugee. All immigration is regulated by the Immigration and Nationality Act of 1952, as amended (most recently in 1980). The predecessor to the 1952 act set a ceiling on immigration and established a system of distributing visas by nationality (defined in most cases by the country of birth). The number, or quota, of visas allotted to each nationality corresponded to the share it had already contributed to the U.S. ethnic make-up. This resulted in a large quota for the United Kingdom and small quotas for southern and Eastern Europe. While the large German quota enabled many refugees from the Hitler regime to enter the United States as regular immigrants, postwar displaced persons and refugees from Eastern Europe who wished to come to the United States had no choice but to wait or accept the terms offered by other countries of immigration.

At first the United States, responding to this need, tried to speed up displaced-person admissions without changing the quota system. About 80,000 Poles, Balts and southern Europeans (about half of them refugees) were admitted under a December 1945 directive by President Truman to use the quota numbers accumulated during the war. And the 215,000 displaced persons admitted under the Displaced Persons Act of 1948 were to be charged against the quotas of future years. It was only with the Refugee Relief Act of 1953 that the United States went outside the quota system by authorizing distribution of 215,000 special nonquota immigrant visas to a number of eligible groups of Europeans and Chinese. The McCarran-Walter Act of 1952, amending the immigration and nationality law, had eliminated the clause excluding Asians as immigrants but had retained the quota system.

Refugees were first mentioned explicitly in the general immigration law in the amendments passed in 1965. The law abolished the national origins quota system and set up in its place a hierarchy of preferences for visa distribution based on personal qualities: that is, relationship with U.S. citizens, accomplishments, labor skills, and so forth. First preference went to the sons and daughters of U.S. citizens: the seventh (and last) to refugees. Hemispheric immigration ceilings established by this law were put together in 1978 to form a worldwide ceiling of 290,000 immigrants per year. Refugees received 6 percent of the ceiling, or 17,400. Refugees, however, did not enter the country on the same terms as others. [As] conditional entrants, [they had to] wait 2 years [under pre-1980 laws] before they could apply for status as immigrants.

There was a definition of the refugee given in the 1965 law; it was narrower than that [in a] 1951 U.N. convention. Refugee programs dependent upon American initiative and funds spanned the globe. And yet the U.S. immigration law of 1965, following the practice of the 1950's, continued to tie refugee status to communism and turmoil in the Middle East. Thus, under the 1965 law, refugees were persons who "because of persecution on account of race, religion, or political opinion . . . have fled from any Communist or Communist-dominated country or area, or from any country in the general area of the Middle East, and are unable or unwilling to return to such country on account of race, religion, or political opinion."

. . . Thus limited by its immigration laws, the United States could not have admitted as many refugees as it has in the past 14 years if the executive branch had not had use of a special authority known as the parole. Instituted by the McCarran-Walter Act of 1952, the parole clause authorized the Attorney General to admit to the United States temporarily, for "emergent reasons" or for reasons deemed in the national interest, *any* alien applying for admission. Referring to the use of the parole to admit over 30,000 Hungarian refugees between 1956 and 1958, Congressman Walter said: "We never anticipated anything of this magnitude, but we did know this sort of situation would arise. That is why the provision was put in the law." The parole enabled the United States to admit refugees from non-Communist countries, such as Chile, after 1973. And in the absence of other authority, the executive branch has had to resort to the parole to admit large numbers of refugees in emergency situations.

"Refugees—An International Obligation,"
Department of State Bulletin, December 1979, pp. 13–14.

tion and Naturalization Service, and the Department of Labor.[7] The data from Eglin Air Force Base are presented here for the first time.

The Eglin profile

Interest in these records was the same: what are the Cubans' background characteristics? Do they differ from previous Cuban refugees now residing in Miami? Do their occupational histories show that few are employable? And if there are a significant number with prison records, who are they and how long had they been incarcerated?

The sample was a 10-percent systematic random selection that identified for study 925 asylum applicants arriving throughout May. As was true of the registration data from Opa Locke, Immigration officials interviewed only persons age 14 or older. Information included age, sex, marital status, last place of residence in Cuba, and occupational histories.

The Eglin sample further documents the familiar observation that these Cubans are young, working-age adults. Sixty-four percent at Eglin were age 20 to 34, compared to 58 percent of all those in Miami. The average age was 33 at Eglin.

Much attention has focused on the predominance of single men in this flow: it is believed that single men are more difficult than family groups to resettle. In fact, and as anticipated by the manner of processing at Coral Gables, there were many single men at Eglin. Men outnumbered women nearly 9 to 1, representing 89.3 percent of the total camp population. At least one-third of both men and women reported they were currently married, with the women more likely to be so than the men: 43.4 percent versus 33.2 percent.

Because most of the new arrivals were in their late twenties and early thirties, they not only have many years ahead in the U.S. labor force, but they also had a chance to accumulate substantial employment experience in Cuba. The nature of this experience is critical to judging them "socially undesirable." How, then, do those sent to Eglin fare?

Whereas unemployment was virtually negligible in both Miami samples, 2.8 percent of the Eglin group reported no employment as their longest held activity in Cuba ("principal job"). This unemployment rate increased to 4.7 percent immediately prior to departure. However, because most were single men, only 15 percent were out of the labor market in Cuba; that is, they were homemakers, students, patients, or soldiers. This compares to one-third of the sample at Opa Locke. Clearly the Cubans at Eglin are used to work and will undoubtedly seek it in the United States.

But what are their occupational experiences? Like those in Miami, they are concentrated in four occupational categories: laborer (25 percent), craftworker (22.7 percent), machine operative (14.1 percent), and transport operative (11.2 percent). The Eglin group also contains nearly the same share of professional and technical workers and service workers. As shown in table 1, the three samples provide a consistent occupational profile.

The Cubans at Eglin had held what would be considered skilled or semiskilled jobs. As craftworkers and laborers, they worked primarily in manufacturing and construction. All three samples show a large number of mechanics, painters, masons, carpenters, heavy equipment operators, electricians, and bakers. Machine operatives at Eglin included lathers, sanders, welders, meatcutters, and press operators. Of course, transportation workers were mainly drivers of trucks, taxis, and buses.

The proportion of professional and technical workers at Eglin also matched that of the Miami groups. Teachers at all grade levels were the largest number of such workers. This possibly reflects the reported significant cutbacks in educational enrollment in Cuba, especially at the university level. There were also a few doctors, nurses, and medical technicians, as well as a number of entertainers and athletes.

These people can hardly be said to have been marginal to the Cuban economy, nor unemployable in the United States. Yet the charge of "undesirable" does not rest solely on occupational background. The most alarming stories concerned the prevalence of criminals.

Ex-offender data. A key question concerning ex-offenders among the refugees is what does a prison record in Cuba mean. In what manner are they "socially undesirable"? For instance, the United States has accepted political prisoners from Cuba as part of normal immigration for several years. Those admitted in the fall of 1979 averaged 10.4 years in prison. Still it is a reasonable and unanswered question whether those with prison records in this most recent, massive flow committed

similar "political" crimes.

The Immigration Service data show how many refugees reported prison records, as well as the duration of their confinement. An initial screening process separated more than 800 former felons who were sent to Federal prisons. Most other ex-offenders remained with the general refugee population. However, only occasionally is it possible to determine why these persons were in jail. Thus, caution is necessary: the following information refers to all persons in the Eglin sample who reported a former offense, regardless of the reason.

Immigration officials recorded that 16.4 percent, or 152 of the sampled emigrants at Eglin, had spent some time in jail.[8] Less than half, however, were in prison at the time of departure: 44.1 percent of the ex-offenders, or only 7.2 percent of the total camp population. Evidently, most of these latest refugees left Cuba from their homes, not through prison gates.

The majority (55.2 percent) of the ex-offenders spent less than 3 years in jail: 6.2 percent for less than 60 days, 7.9 percent for less than 1 year, 24.7 percent between 1 and 2 years, and 16.4 percent from 2 to 3 years. Reasons given for these jail terms included robbery (1 to 2 years), drugs (2 to 3 years), vagrancy, refusing military service or to work for the state, and caught trying to escape to the United States.

Six percent of all those with prison records specifically stated they were political prisoners. This is undoubtedly an underestimate. Another 3 percent could be included for refusing service to the state, either military or labor. And a small but significant proportion had been in prison dating from the early 1960's, when many political prisoners were first jailed. But the most important reason for the probable undercount is simply that most ex-offenders did not report the nature of their crime. Consequently, I would argue that between 9 percent and 20 percent of those at Eglin who reported a prior offense could be classified as political prisoners.

Do these ex-offenders account for an identifiable minority? Evidently not. The average age of the ex-offenders was 32.6, virtually the same as the total Eglin sample. Both groups also had a similar proportion married, and only slightly more of the ex-offenders were men. The only significant difference was in their occupational backgrounds. (See table 2.)

Overall, ex-offenders were about as likely as the total Eglin group to be employed in each occupational category, with two exceptions. Just prior to departure, ex-offenders had experienced an overall shift out of operative jobs and into nonfarm laborer positions. There was also a less significant shift out of the professional and service sector and into construction. There could be many reasons for such a shift, but by U.S. standards, this represents a downward slide in skill requirements, status, and wages.

Along with this shift, the ex-offenders encountered a doubling of their unemployment rate (which had already been twice that of the total Eglin group), as shown in the following tabulation:

	Out of labor market		*Unemployed*	
	Number	*Percent*	*Number*	*Percent*
Total Eglin sample:				
Principal job . . .	152	16.7	21	2.8
Last job	139	15.3	36	4.7
Ex-offenders:				
Principal job . . .	61	40.1	5	5.5
Last job	72	47.7	9	11.4

Evidently, the ex-offenders shared with all the Eglin-bound refugees a significant increase in economic hardship prior to leaving. But ex-offenders suffered doubly, perhaps because of their prior offense.

What can be learned from this background profile? Evidently, the refugees' experiences in Cuba do not jus-

tify the alarming charges of social undesirability, especially in terms of their occupational histories. Rather than on the margins of the labor market, the recently arrived Cubans have served the mainstream of the urban Cuban economy. But what of their future in the United States? What jobs are they likely to find?

Role of existing enclave

The future of the 1980 Cuban refugees can not be separated from the history of the entire post-revolution exodus. The Cubans who came before should serve not only as an example of what may come but, given the resettlement program's special emphasis on family reunification and sponsorship, as active participants in the process of adaptation to American life. For many new arrivals, the presence and vitality of the Cuban-American community will cushion the adjustments usually required of those involved in such migrations. In this ethnic enclave, many will find jobs, often without the need to learn English. And, socially, many things will remain the same; for in Miami, you "can be born, or die and be buried, Cuban style."[9]

Like most refugee migrations, the Cuban exodus has developed through a series of outflows, with each group projecting distinct background profiles and encountering diverse experiences in the United States. The importance of this sequential migration is that each wave sets the stage for the next. The earliest Cuban refugees were the landowners, bankers, government officials, and businessmen who benefited greatly from U.S. connections and who, as a result, had much to lose from the revolution. Besides their wealth and status, they also had attained a level of education far exceeding the remainder of the native Cuban population. A 1962 sample showed that 36 percent of this first wave had 12 years or more of formal schooling. At the time, only 4 percent of the entire Cuban population had such advanced education.[10]

The Cuban missile crisis stopped the outflow in 1962; it restarted 3 years later, when the two governments agreed to a series of flights—the "aerial bridge"—that would bring any person who desired to the United States (except those of military age and in strategic economic positions). Approximately 40 percent of the total exodus, excluding the most recent group, arrived on these flights from 1965 to 1973.

These aerial-bridge refugees also represented the upper socioeconomic strata of pre-revolutionary Cuba. As one journalist reported it then,

> to a great extent these people represent the professional and business class of Cuba; the able, the educated, the successful. The struggle in most Latin American countries is to build a stable middle class; that of Cuba has been gutted. This exodus is the biggest brain drain the Western Hemisphere has known.[11]

A survey in 1968 added support. The aerial-bridge arrivals had a level of formal schooling that still outstripped the source population. Eleanor Rogg found that virtually the same percentage (37 percent) in 1968 had 12 years or more of education, as in the earlier wave.[12]

The earliest exiles were able, in effect, to transplant their prerevolutionary Cuban social position into fertile U.S. economic soil. Many in the first wave brought money with them or, more likely, had transferred substantial funds to the United States before their departure. Upon arrival, both Federal and private-business loans were readily available, as were substantial Federal funds for education and assistance. Some U.S. employers also rehired their former employees from Cuban subsidiaries.

Nevertheless, many experienced downward social mobility as they took whatever jobs were available—a characteristic common to refugees and immigrants. Professionals also experienced initial licensing problems, forcing many of them to accept jobs well below their level of training. Consequently, much of the apparent success of these early arrivals once in the United States resulted simply from their substantial initial underemployment and the fact that their subsequent upward mobility was merely a return to their former statuses.[13]

The vitality of this Cuban-American enclave today is considerable, as a recent albeit self-congratulatory profile of the Miami enclave testifies.[14] In Dade County, Cubans account for 16 (out of 62) bank presidents, 250 vice presidents, and more than 500 other bank officers. Approximately one-third (18,000) of the businesses in Miami are Cuban owned or operated. On the labor side, 85 percent of the garment industry's factory workforce is Cuban-American. Cubans staff most of the hotels, and their share of construction workers has reportedly reached nearly 75 percent.

But neither should the enclave's success be overstated. The same article notes that the average income of the Cuban head of household in Miami is only $15,000 per year, with 31 percent earning less than $12,000. Nationwide, Cubans have an unemployment rate significantly higher than the total civilian labor force, even though they are, on average an older group—typically less subject to joblessness.[15]

The Cuban flow has also significantly changed in background composition. Lourdes Casal and Andres Hernandez, for example, have noted a steady decline in the average educational levels of each successive cohort of Cuban refugees. This began in the later years of the aerial bridge and has continued.[16]

The compositional change has had an impact on Cuban communities in the United States. The later arrivals have, in a sense, become the working class—lower waged and skilled—for the golden exiles of the 1960's and early 1970's. Thus, there has been a total transplantation of the prerevolutionary Cuban social structure to Miami, with all the implications of unequal wealth, power, and prestige. The recent emigrants will add to the lower strata.

1973–74 arrivals compared

Insight into how the new Cuban immigrants will progress in the United States may be gained by studying a similar group who entered during 1973–74. This comparison, although not precise, demonstrates not only the changing composition of the Cuban migration, but identifies the ability of the ethnic enclave to incorporate subsequent newcomers.

The comparison group comprises 590 Cuban men who arrived after the close of the aerial-bridge. Most left Cuba several years before and had spent time in Spain. Interviewed for the first time upon arrival, they were tracked and reinterviewed in 1976–77 and again in 1979. The series of interviews provides a profile of their experiences over 6 to 7 years in the United States.[17]

The 1973–74 group shares with the recent arrivals a distinctly working-class character. Only 22 percent had attained 12 years of formal schooling. This was significantly lower than the earlier refugees, but still higher than the Cuban population. Their average education, 8.6 years, was virtually the same as those sampled recently in Miami. And, reflecting their lower education, the 1973–74 sample shared with the recent arrivals a significant lack of English knowledge.

The occupational histories of the 1973–74 immigrants correspond to the contemporary economic reforms in Cuba intended to socialize the remaining, smaller scale sectors of the private urban economy. In fact, although political pressures continued to be a primary reason for leaving, they were just as likely to mention the inability of achieving, over a longer period, a higher standard of living. The evidence that many of the Eglin-based Cubans suffered increased economic hardship prior to departure suggests that the motivations of the two groups may be similar, too.

About one-third (32.5 percent) of the 1973–74 group derived their income in Cuba from either government or educational institutions. Wholesale and retail sales accounted for another 21.2 percent, and direct personal services employed 15.1 percent. A rough approximation with U.S. occupational classifications shows that nearly 30 percent were craftworkers or nontransport machine operatives; including supervisors, artisans, plumbers, electricians, carpenters, butchers, and bakers. Service-workers accounted for 19.7 percent. One-quarter held white-collar or professional jobs: a category combining professional and technical workers with clerical workers.

These occupational origins correspond rather closely with the pattern among the 1980 arrivals, especially in their common concentration in craft and operative jobs. To the extent that these background experiences help in the U.S. labor market, the progress of the 1973–74 group may provide a clue as to the future of the latest arrivals. Both groups, by the way, arrived in the midst of a recession, although the 1974–75 downturn was probably more severe.

Almost all 1973–74 immigrants settled in Miami, where 48 percent found their first employment as craftworkers or machine operatives. This indicates a substantial, overall shift to these categories from other occupations held in Cuba. Another 38 percent were unskilled laborers, and only 5 percent were professionals or managers. The majority located employment in manufacturing (34.3 percent) or construction (22.0 percent).

After 3 years in the United States, most had regained positions comparable to those abandoned in Cuba. They earned, on average, a modest $7,764 per year. But more importantly, 40 percent were employed by firms that were owned or operated by other Cubans. In fact, preliminary figures from the interviews 6 years later show that the Cuban enclave still employed 40 percent of these refugees.[18]

The 1973–74 arrivals were able to utilize their working-class skills in the U.S. labor market.[19] Higher levels of education and English knowledge were particularly associated with greater earnings. But even more important was the positive impact of enclave participation. Within this 1973–74 group, those who worked for Cuban owned or managed firms earned significantly more each month.

By projecting this future on the majority of the recent immigrants, it appears that they will find self-sustaining employment within a relatively short period as part of the Cuban-American working class. Thus, in addition to its outpouring of emergency relief in Miami, the Cuban enclave will also provide employment for a substantial proportion of the new arrivals. This direct contribution of the Cuban enclave is much more important in the present context than before because the current posture of the Carter Administration is to ask more of the affected local communities than ever before.

Resettlement hampered

There are several reasons why this resettlement of Cuban refugees may not succeed as well as previous efforts. Most of the reasons have been well-played in the press and pointed to in this article. The size of the influx within such a short period made orderly processing extremely difficult. Recurring problems locating responsible sponsors were a consequence. Other characteristics of these refugees, or the profiles of those not represented in these samples, may also identify problems. The apparently small but significant proportion of homosexuals in this group is merely another example. And the current recession, coupled with conservative fiscal policy to combat inflation, promise difficulties for all job seekers.

In addition, there are two particular changes in progress that will not only have an effect on these Cubans, but because of the timing of this influx, will be pushed along with greater speed—and perhaps less care.

The new Cuban refugees came only weeks after Congress passed legislation finally regularizing the procedure for admitting refugees. (See box, p. 41.) The Cubans, and with them the Haitians, became the first test of perhaps the weakest section of the law, procedures for case by case review of asylum applicants. As if someone had studied the legislation to determine what it did not cover, recent events touched the one area not contemplated in detail beforehand—the United States as a country of first asylum. Indeed, much of the delay in the Carter Administration's deliberations on the Cubans would be attributed to an attempt to conceptualize the United States as a place of first asylum. But searches for other countries to accept large proportions of these Cubans and appeals to the United Nations lacked the urgency of other contemporary moves by countries of first asylum to gain international cooperation. Recall that, in the case of the Vietnamese "boat people," the world responded only after Malaysia and Singapore began towing refugee-laden boats back out to sea.

Also like the Southeast Asian countries of first asylum, the Carter Administration first held that it could not afford to accept the entire flow—thus setting up a monumental dilemma. U.S. refugee policy is traveling in two opposing directions: at once reaching out to compelling international and humanitarian problems, while withdrawing from policies of domestic relief. The result is a series of false steps in both directions and much bewilderment. Even the eventual offer of Federal payment for some services provided Cuban and Haitian refugees ended up as much less than it appeared. The plan to make them eligible for certain social programs apparently did not take into account the fact that Florida has no programs for emergency assistance or medical help.[20]

The 1980 Cuban influx also occurred at a bad time, not only because the public expressed an anti-immigration mood, with U.S. citizens pressed by unemployment, inflation, and foreign conflict, but because of the effort to reform the immigration law. The combination of these factors elevated the significance of the Cuban immigration to unwarranted importance in relation to other national problems. Immigrants became associated with all kinds of social and economic ills, most commonly unemployment. But refusing to admit 123,000 people as refugees would not even begin to solve the Nation's unemployment problem. ☐

——FOOTNOTES——

[1] Statement by Victor H. Palmeiri, U.S. Coordinator for Refugee Affairs, in a press release on June 20, 1980.

[2] Initially, without a status, the new Cuban immigrants were actually undocumented aliens, illegally transported to the United States by U.S. citizens. But, unlike other illegal aliens who are subject to deportation, the Immigration and Naturalization Service promptly accepted their application for status, gave them a visa, and authorization to work.

[3] *The Washington Post*, Apr. 26, 1980, p. A22.

[4] Part of the reason for this change of responsibility was that without a declared refugee status for the Cubans, the Cuban Refugee Emergency Center, which is funded by the Department of Health and Human Services, could not have remained involved.

[5] For more detail, see Robert L. Bach, "A Profile of the Recent Cuban Refugees Arriving in Miami," *Migration Today*, forthcoming.

[6] *Ibid.*

[7] By the time this article is published, the profile of all 123,000 or so will be available from either the author or the Coordinator's office.

[8] Of course, whether the applicants told the truth is debatable. Although there is no way to check, my impression is that the incentive was there to be truthful. Immigration and Naturalization Service interviewers were instructed to ask for detail if an applicant could not account for blocks of time in his or her occupational history, plus the applicants knew that they would also be interviewed and cleared through the Federal Bureau of Investigations and Central Intelligence Agency.

Immigration and employment: a need for policy coordination

In coming years, immigrants may constitute as much as 45 percent of U.S. labor-force growth; efforts are needed to ensure that national goals for immigration and employment are complementary

DAVID S. NORTH AND PHILIP L. MARTIN

All nations have immigration policies, usually quite explicit, and all nations have labor market policies, which are at least implicit. In most industrial democracies, the two policies are strongly linked and may even be administered by the same government agency. In the United States, however, there is often little coordination between the two, despite the major impact of international migration on the U.S. labor market.

Logic would seem to suggest that there should be a close relationship between these policies. First, the Government is in a stronger position to alter the size and characteristics of the alien work force than it is to make similar adjustments in the resident labor force.

Secondly, international migrants have made a major contribution to the growth of the U.S. labor force, which increased from 82.3 million in 1968 to 102.5 million in 1978, or by about 2 million per year.[1] In its intermediate growth rate model, the Bureau of Labor Statistics projects that this rate of increase will continue through 1985 and will then drop to 1.2 million annually through 1990.[2]

Since the beginning of fiscal 1978, the number of legal migrants recorded by the Immigration and Naturalization Service has been about 600,000 per year, a flow which seems destined to remain constant or even increase, given the continuing entry of refugees. About one-half of the immigrants join the labor force within 2 years of their arrival. This proportion will rise in the following two decades as grown immigrant children join the labor force.[3]

The 300,000 aliens who become employed soon after arrival (15 percent of the current rate of increase in the labor force) represent only *legal* immigrants. The labor-force impact of foreign-born workers should be adjusted upwards to account for illegal or undocumented workers. These workers may equal or substantially exceed the number of legal immigrants. Thus, 30 to 45 percent of the annual growth of the labor force may consist of newly arrived aliens.

New immigrants, both legal and illegal, are spread unevenly throughout the Nation. They tend, as have previous generations of immigrants, to settle where they expect to find a supporting community, economic opportunities and a familiar climate. For example, in 1975, 38.9 percent of the arriving legal immigrants settled in 10 cities, which accounted for only 9.8 percent of the Nation's resident population.[4] However, as table 1 indicates, the labor markets in which the migrants cluster often have higher unemployment rates than the national average, which was 5.8 percent in 1979.

With these preliminary observations recorded, we turn to four questions:

1. What are the objectives of U.S. policies regarding immigration and employment?
2. How are these policies made?
3. How do these policies interact with each other?
4. What, if anything, should be done to change the situation?

Policy objectives. U.S. employment policies have multiple goals. The primary objective is full employment—de-

---

David S. North is director of the Center for Labor and Migration Studies, New TransCentury Foundation, Washington, D.C. Philip L. Martin is an associate professor of agricultural economics at the University of California at Davis.

fined as an economic climate in which anyone "able, willing, and seeking work" can find a job. Employment policies may also be intended to curb inflationary pressure, encourage adequate wages and safe and decent working conditions, increase job satisfaction, and promote production efficiency and more widespread use of collective bargaining. There is an alternative view, that employment policy should seek primarily to increase the gross national product. Those who hold this view feel that the forces of the free market should generally determine the rewards for and the conditions of work.

Employment policy goals are not always mutually compatible at any time. For example, increasing job satisfaction may temporarily slow productivity growth and intensify inflationary pressures. Fortunately, certain policy tools—counseling and training, labor-market information exchanges, wage and training subsidies, and direct public service employment—permit remedial efforts to be concentrated on labor markets experiencing special bottlenecks or on groups of workers with unique economic problems.

The goals of the current *de jure* immigration policy are also multiple: to admit relatives of U.S. citizens and permanent resident aliens; to recruit a few needed workers; and to absorb some portion of the world's refugee population, generally those fleeing Communist countries. In 1978, the United States admitted 132,780 refugees and 30,877 workers and family members in the occupational preference categories. Virtually all of the remaining 437,785 entrants were accepted because they were relatives of U.S. residents.

The only immigrants screened for labor-market characteristics are the workers for whom the occupational preferences are sought. These workers receive labor certifications from the U.S. Department of Labor if their would-be employers can prove that their skills are needed, and that their presence will not depress the U.S. labor market. However, the state of the labor market is not considered in admitting the great majority of workers. In fact, the total flow of immigrants is affected more by individual decisions of U.S. residents seeking the admission of relatives, and the actions of foreign officials creating flows of refugees than it is by the U.S. Government.

The Nation also has a *de facto* immigration policy, which permits the entry and presence of millions of ille-

[1] Population data are 1977 estimates.

[2] Data are annual averages. The national annual unemployment rate for 1979 was 5.8 percent. Average unemployment rate calculated by dividing the total labor force for each group of cities into the total number of unemployed for the group.

NOTE: Cities selected were those with populations of more than 100,000 (in 1970), and immigrant arrivals totaling more than 500 in fiscal 1978.

SOURCE: Ratio of 1978 arriving immigrants to population computed from *INS Annual Report, 1978*, table 12A (for immigrants), and *Statistical Abstract of the United States, 1979*, table 24 (for population); 1979 labor-market data from computer printout supplied by the Division of Local Area Unemployment Statistics, Bureau of Labor Statistics.

gal migrants. The "goals" of this policy include the creation of a substantial work force without legal rights for the benefit of some U.S. employers, while permitting Mexico and other less developed countries to export a substantial percentage of their excess labor force.

Policymaking. The formation of labor-market policy might be compared with the continuous cooking of a stew; the flavor changes as ingredients are added, but the process is an ongoing one and the changes are not abrupt. Employment policy operates through a series of vehicles, such as the setting of the minimum wage, adjustment of the unemployment insurance and workers' compensation systems, change in the laws and the personnel of the National Labor Relations Board, and variation in the funding and emphasis of the Comprehensive Employment and Training Act (CETA). Many of these decisions are Federal, but some are also made at the State and local levels. Policymaking in this arena involves the interested parties in a never-ending round of legislative, executive, and judicial exercises, alternatively battling and compromising with each other. The focus is essentially domestic, far more concerned with inflation, unemployment, poverty, and productivity than with immigration.

In contrast, immigration policymaking is not continuous, and its focus is heavily influenced by international considerations. The basic structure of the immigration law is changed about once a generation (most recently in 1965, when the 1921 country-of-origin quota system was eliminated). Immigration policy develops in fits and starts, as policymakers react negatively to existing practices and because of its international elements, its results are harder to predict and control.

A further complication is the *locus* of employment and immigration policymaking. The congressional labor and taxation committees dealing with employment policy do not deal with immigration policy, which is handled by the judiciary committees, and vice versa. Similarly, the U.S. Department of Labor plays a lead role in making employment policy, but only a minor one in immigration policy, which is administered by the Departments of State and Justice.

Policy interactions. Given the different objectives of both the *de facto* and *de jure* immigration policies on one hand and operative employment policy on the other, and the different ways in which decisions are made in these fields, it should be no surprise that there is little policy coordination.

The principal area of conflict is between the full employment and improved jobs goals of employment policy and the treatment of illegal immigrants. The U.S. Government devotes $20 billion annually to unemployment insurance to cope with the short-term effects of unemployment, and $8 billion more to CETA in a search for longer term solutions to the problem. Simultaneously, however, it tolerates the presence of perhaps millions of low-wage illegal immigrant workers, who compete with some U.S. residents for jobs, and tend to depress wages and working conditions of millions of others. The distributional effects of immigrant labor, especially if illegal, are not well understood, but it is clear that some employers, workers, and consumers are benefiting while others lose. Even more ambiguous are the consequences of the long-term use of so many illegal migrants.

The alternatives available. Bearing in mind the difficulties inherent in immigration policymaking, the Congress in 1978 created the Select Commission on Immigration and Refugee Policy to address these and other complex issues. The Commission, headed by Father Theodore Hesburgh, president of Notre Dame University, will report its findings to the Congress and the President next year.

Early indications are that the Commission recognizes the conflicts between existing immigration and related labor-market policies, and prefers to diminish them.[5] With regard to its final recommendations, the Commission appears to have several options:

- One is the preservation of the status quo, unhappy as it may be, as a rough compromise, the best available in an imperfect world.
- Another would be to leave the thrust of *de jure* immigration policy essentially as it is, but to devote more resources to its enforcement.[6]
- A third approach would be, simultaneously, to seek to change the law so that it comes closer to today's realities, while seeking more vigorous enforcement of the new immigration policy.

The third option is the most likely approach, and it would be helpful if the Commission would stress the need for coordination of the Nation's labor-market and immigration policies.

Specific alternatives open to the Commission include: legalizing the presence of some of the undocumented workers currently in the United States, making provisions for larger flows of legal immigrants in the future, and setting up a program of employer sanctions which would make it illegal to hire aliens without proper documentation. Or it might propose a guest- or nonimmigrant-worker program, as discussed elsewhere in this issue.

Whatever the Commission decides, it will do so after having faced the complex conflicts in employment and immigration policymaking. That, in itself, is a welcome development.[7]

Adjusting to democracy

> . . . The immigrant must be taught that he must stand straight up on his own feet; that the ward politician is dependent on him—on his vote—and not he on the ward politician. In this way he first learns that he is a part of the Government, and while this is done by indirection, in a large sense, there is no other force that is doing it at all. The Pole, the Bohemian, the Lithuanian, the Slovak, and to a much lesser degree the Galician, have inherited the feeling that somehow government is a thing inimical to their natural development . . . Being weaker than it they must be silent in its presence, and if forced to speak, lie, as for them to tell the truth would mean imprisonment or death.

—CARROLL D. WRIGHT

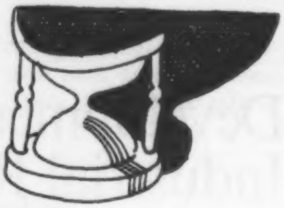
January 1905, No. 56, p. 5.

Major Agreements Expiring Next Month



This list of collective bargaining agreements expiring in November is based on contracts on file in the Bureau's Office of Wages and Industrial Relations. The list includes agreements covering 1,000 workers or more.

Employer and location	Industry	Union[1]	Number of workers
Apartment Building Owners and Managers Association of Chicago (Illinois)	Services	Service Employees	3,000
Chicago Dry Cleaners Association (Chicago, Ill.)	Services	Teamsters; and Laundry, Dry Cleaning, and Dye House Workers (Ind.)	4,000
Chicago Real Estate Owners Council (Chicago, Ill.)	Services	Service Employees	4,500
Dana Corp., Parish Frame Division (Reading, Pa.)	Transportation equipment	Steelworkers	1,800
Foster Grant, Inc. (Interstate)	Rubber	Retail, Wholesale, and Department Store Union	1,100
Gibson Products Corp. (Greenville, Mich.)	Electrical products	Auto Workers (Ind.)	3,000
Goulds Pumps, Inc. (Seneca Falls, N.Y.)	Machinery	Steelworkers	1,100
Houston Food Council, Chain Food Stores[2] (Houston, Tex.)	Retail trade	Food and Commercial Workers	1,850
ICI United States, Inc. (Charlestown, Ind.)	Instruments	Chemical Workers	1,000
Lockheed Aircraft Corp. (Burbank, Calif.)	Transportation equipment	Engineers and Scientists Guild (Ind.)	2,200
Louisville Gas and Electric Co. (Louisville, Ky.)	Utilities	Independent Protective Association of Utility Workers (Ind.)	2,700
Olin Corp. (East Alton, Ill.)	Instruments	Machinists	3,750
Rohr Industries, Inc. (Chula Vista, Calif.)	Transportation equipment	Machinists	3,000
Rohr Industries, Inc. (Riverside, Calif.)	Transportation equipment	Machinists	1,300
RCA Corp. (Interstate)	Electrical products	Electrical Workers (IUE)	5,650
RCA Corp. (Interstate)	Services	Electrical Workers (IBEW)	2,300
RCA Global Communications Inc., Communications Trade Division (Interstate)	Communication	Teamsters (Ind.)	1,000
Safeway Stores, Inc. (Texas)	Retail trade	Food and Commercial Workers	1,300
Textile Maintenance Institute of Chicagoland (Illinois)	Services	Teamsters; and Laundry, Dry Cleaning and Dye House Workers (Ind.)	5,000
Trane Co. (Clarksville, Tenn.)	Machinery	Machinists	1,300
Tropicana Products, Inc. (Bradenton, Fla.)	Food products	Teamsters (Ind.)	1,500

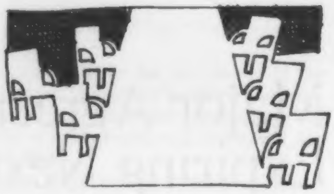
Developments in Industrial Relations



Job protection stressed in telephone contracts

A scheduled mid-August strike against American Telephone and Telegraph Co. and its operating and manufacturing arms was averted when the Communications Workers accepted a 3-year offer for the 525,000 workers it represents in the Bell System. As usual, the International Brotherhood of Electrical Workers settled on similar terms for its 119,000 workers, as did the Telecommunications International Union for 56,000 workers. During the bargaining, which began in June, the three labor organizations worked together on formulating demands and in responding to company proposals. Although there were no strikes over national issues, there were several brief strikes over local issues, including a 16-hour walkout and later a 19-hour walkout by 33,000 CWA members employed by the New York Telephone Co., and a 30-hour walkout involving 70,000 CWA members at Pacific Telephone Co. in California and Nevada. The last national strike against the Bell System, lasting 5 days, preceded the 1971 settlement.

CWA President Glenn Watts valued the settlement package at 34.9 percent. Union officials calculated the two wage escalator adjustments (August of 1981 and 1982) on the assumption that the Consumer Price Index for Urban Wage Earners and Clerical Workers (CPI-W) would rise 9.5 percent in the year ending May 1981 and 9.7 percent in the year ending 1982. There was no immediate comment on the settlement by the Council on Wage and Price Stability, but Watts said the annual increase in compensation was "comfortably within" the Administration's 7.5 to 9.5 percent annual guideline, which is based on assumed 7.5 percent annual rises in the CPI-W and also permits the exclusion of certain increases in the cost of benefits.

CWA officials estimated that the August 1980 initial wage increase would average 9.24 percent, or $28.82 a week. Pay rates were not increased for employees in the first step of the progression schedules, but those at the top of the schedules received 10.2 percent increases and those in intermediate steps received a smaller increase.

For the 1981 and 1982 increases, workers in the top progression step will receive 3 percent increases; those in the intermediate steps will receive a smaller increase. The union estimated the increases at 2.67 percent, or $9.16 weekly, in 1981 and 2.68 percent, or $10.17, in 1982. In addition, telephone operators received a two-stage "upgrading" increase up to a maximum of $7.50 a week for those at the top step.

The two wage escalator adjustments will be calculated at the new rate of 55 cents a week plus 0.65 percent of the individual's weekly rate for each 1 percent increase in the CPI-W. The previous rate was 50 cents a week plus 0.6 percent of the weekly rate for each 1 percent index rise. According to the union, the new formula will recover about 80 percent of price increases measured by the CPI-W, compared with 75 percent for the previous formula.

The settlement included 14 provisions that, according to the union, dealt with "the interrelated issues of job security and job pressures" stemming from "an ailing economy and the rapidly changing state of technology." Included were:

- Four paid and one unpaid "excused work days" a year for regular employees (instead of three paid and one unpaid), in addition to a one-time excused day on December 26, 1980.
- Three weeks of paid vacation after 7 years of service (formerly 8 years), effective in 1981.
- A new procedure for scheduling vacations.
- Termination of the practice of monitoring some calls handled by operators.
- Establishment of a joint committee to assist employees affected by technological changes.
- Adoption of a plan protecting 15-year employees downgraded because of technological changes from pay reduction for the balance of the contract term, with an increasing reduction to apply afterwards.
- A 50-percent increase in supplemental income protection payments to laid-off workers, bringing the payment rate to 40 percent of the basic weekly wage plus $8 per year of service (maximum payment of $18,000). Eligibility was extended to employees who are age 62 with 20 years of service and those whose age plus service total 75.
- An understanding that "traditional" telephone work will not be contracted out if it "will currently and di-

---

"Developments in Industrial Relations" is prepared by George Ruben and other members of the staff of the Division of Trends in Employee Compensation, Bureau of Labor Statistics, and is largely based on information from secondary sources.

rectly cause layoffs or part-timing of employees."

- A "successorship memorandum of agreement" providing various income and job security protections for employees transferred because of a reorganization of the Bell System.

Major changes in pensions included provisions for (1) two "guaranteed cost-of-living" adjustments in benefits; (2) retirement at full benefit rates for 30-year employees, (previously, the employee's pension was reduced 3 percent for each year under age 55 at retirement); (3) an improved and simplified normal pension formula—the October 1980 increases (for employees retiring after August 1980) range from $12.11 to $29.85 a month for each year of service, depending on preretirement earnings, August 1981 increases range from $13.35 to $32.73, and August 1982 increases range from $14.78 to $35.98; and (4) increases in minimum pensions, ranging from 48 percent after 20 years of service to 115 percent after 40 years.

Other provisions called for improvements in health, dental, life insurance, and vision care benefits and an increase in the mileage allowance for authorized use of a personal automobile.

First woman on AFL–CIO Executive Council

The AFL–CIO's Executive Council selected Joyce D. Miller as its first female member. Miller is a vice president of the Amalgamated Clothing and Textile Workers Union and president of the Coalition of Labor Union Women. In order to elect a woman, the Council waived its rules that a member be a chief officer of a union and that two representatives of the same union could not serve on the 35-member council. Murray Finley, president of the Amalgamated Clothing and Textile Workers, was already a council member. AFL–CIO President Lane Kirkland said he hoped the time would come when women as well as minorities would gain election to union presidencies, making special rules unnecessary.

The chief item of business at the summer session was the Council's endorsement of President Jimmy Carter for re-election, calling him the "clear choice" for American workers. The Council said it would ask the Federation's General Board to endorse the Democratic ticket and to plan a vigorous campaign to inform union members about the candidates and issues in the 1980 election campaign.

The Council took steps to direct pension money into "socially desirable" investments beneficial to labor by endorsing the creation of a Government-guaranteed "super" fund of pension assets. The purpose of the fund would be to (1) encourage investments in "job-creating" industries such as construction and transportation; (2) coordinate pension funds proxy votes on issues before shareholders; (3) provide a clearinghouse to assist investors in avoiding companies with poor labor relations; and (4) encourage unions to press for a larger role in managing pension funds.

Airline workers get new contract

American Airlines and the Transport Workers Union negotiated a 30-month agreement providing for general wage increases of 6 percent retroactive to March 1980, 2 percent in September 1980, 4 percent in March and September of 1981, and 4 percent in March of 1982. The agreement, which covered 12,400 ground service employees, continued the cost-of-living clause, providing annual adjustments of 1 cent for each 0.3-point rise in the Bureau of Labor Statistics Consumer Price Index (1967=100) in September of 1980 and 1981 and August of 1982, with maximum adjustments of 18, 22, and 22 cents, respectively (the previous contract allowed 34 cents over its 30-month term).

Longevity pay was increased to a maximum of 15 cents an hour (from 13 cents). Paid vacation was liberalized by providing for 4 weeks after 10 years of service (formerly 12 years) and 5 weeks after 17 years (formerly 20) beginning in 1981. Employees can accumulate up to 130 days of sick leave effective in 1981 (formerly 120 days) and 140 days in 1982 and will receive $25 for each day of unused sick leave at retirement (previously, employees received $12 for each unused day at the end of each year).

Subject to government approval, all previous pension contributions were to be refunded and workers were to receive pension credit for years in which they did not contribute. Other improvements included a 25-cent payment for the first government license held and 20 cents for the second, effective in December 1980 (formerly 20 and 15 cents), increasing to 35 and 30 cents in December 1981. Line-pay for mechanics, fleet, and ground service employees was increased to 10 cents (formerly 5 cents), effective in September 1981.

Initial contract at Southern textile firm

A 9-year dispute between the Clothing and Textile Workers union and Wellman Industries, Inc., ended when the parties agreed on an initial contract for 1,000 workers in Johnsonville, S.C. In addition, the textile firm agreed to an affirmative action plan and cash settlements to workers who were affected by seven National Labor Relations Board findings that Wellman had engaged in unfair labor practices.

Wellman employees voted in April 1972 for representation by the Textile Workers Union of America. However, subsequent efforts to negotiate a contract were unsuccessful and the union complained to the National

Labor Relations Board that Wellman was engaging in unfair labor practices. The Board upheld the charges and rejected the company's contention that it did not have to negotiate with the union because its employees were not permitted to vote on the Textile Workers Union of America and the Clothing Workers merger that resulted in formation of the ACTWU.

Under the settlement, Wellman will pay a total of $465,000 to employees who lost earnings as a result of layoffs or reductions in pay or who were improperly discharged. Under a consent decree entered in U.S. District Court, the company agreed to increase, within 3 years, the number of black employees to 48 percent of skilled jobs, 35 percent of office jobs, and 15 percent of officials and managers. To help in this effort, Wellman will set up a $100,000 fund for training employees.

The contract provided for a 9-percent wage increase and for reopening bargaining on wages and benefits in both the second and third years. Other terms included a seventh paid holiday and adoption of funeral leave, jury duty, and military duty pay.

In another development involving ACTWU, the union charged that J. P. Stevens & Co., had not agreed to a July 1980 wage increase for the unionized employees at its Roanoke Rapids, N.C., plant to punish them and to "chill the union organizing activities elsewhere." (See *Monthly Labor Review*, September 1980, p. 60, for information on wage increases that were granted or negotiated at other southern textile companies in July 1980.)

The ACTWU, which for 6 years has been trying to negotiate an initial contract at the plant, recalled that the National Labor Relations Board issued a complaint against Stevens for denying a 1979 wage increase to the 3,000 workers. The complaint asserted that the company had withheld the increase from the employees because they had joined or supported the union for mutual protection and to engage in collective bargaining.

Workers agree to purchase printing firm

Employees agreed to purchase Dayton (Ohio) Press, Inc., to avert a possible closing of the magazine printing firm. The agreement between the parent Charter Co. and 13 unions calls for Charter to receive a $35-million long-term note. The employees would borrow $100 million, of which $70 million would be used for new machinery and $30 million for operating expenses. To partly offset these costs, the employees agreed to a 14-percent wage reduction. An official of the Graphic Arts union, which represents 850 of the workers, said that the purchase was contingent on obtaining long-term printing contracts, as well as on arranging the financing.

Prior to the decision to sell the plant to the employees, Charter had considered moving the operation to Tennessee, Virginia, or Georgia; selling the business to another firm; or investing $70 million in new rotagravure presses necessary for the firm to be competitive with other magazine printers.

The company ruled out buying new presses after the unions refused to accept a wage freeze that Charter said was necessary to equalize labor costs with its competitors. The rejected proposal, made in February 1980, was for a 15-year contract with wages to be frozen until the five competitors' wages equalled those at Dayton Press, which was expected to occur in 1983. During the balance of the 15-year period, employees would have received the average amount of the increases received by the employees of the five companies. According to a union official, straight-time pay for the unionized workers at Dayton Press ranged from $15,674 to $20,072 a year at the time of the proposal.

Dayton Press has been losing money for the past 4 years. In February, employment was 2,600, including 700 on layoff, compared with 5,700 in 1970.

Benzene standard overturned

The Supreme Court ruled by a 5 to 4 vote that the U.S. Department of Labor's 1977 standard for worker exposure to benzene was invalid because the Department had not proved it was necessary. Justice John Paul Stevens, writing for four members of the Court, said that the Occupational Safety and Health Administration in issuing the standard had failed to prove that it was "reasonably necessary and appropriate" to remedy a "significant risk of material health impairment." Stevens said OSHA had acted incorrectly in reducing the allowable exposure level to one part of benzene per million parts of air, from 10 ppm, because the agency had not obtained "empirical evidence" or "opinion testimony" that "exposure to benzene at or below the 10 ppm level had ever in fact caused leukemia." He said that OSHA's rationale for tightening the standard was its long-standing position that exposure to cancer-causing agents must be reduced to the lowest possible level because there is no such thing as a "safe level."

Charles Dibona, president of the American Petroleum Institute, said that the court's ruling establishes that "health regulations in this country must be made on the basis of scientific fact rather than pure speculation." Edmund B. Frost, general counsel of the Chemical Manufacturers' Association, said, "Congress did not mandate—nor can OSHA achieve—a perfectly risk-free society. OSHA can now regulate only significant, not theoretical, risks."

Deputy Assistant Secretary of Labor Basil Whiting conceded that the ruling will make it more difficult to set standards but said OSHA will "press forward in regulating benzene, as well as in regulating other cancer-causing and toxic substances."

The legal challenge to the benzene standard, initiated by the American Petroleum Institute, had resulted in a ruling by the 5th U.S. Circuit Court of Appeals in New Orleans that the standard was unreasonable because of a lack of evidence of significant health benefits. The appeal before the Supreme Court that resulted in the upholding of the lower courts' ruling was *Industrial Union Department (of the AFL-CIO)* vs. *American Petroleum Institute.* (For a fuller discussion of the case, see "Significant Decisions in Labor Cases," September 1980, pp. 53–54.)

Minority quotas for U.S. contracts upheld

In one of the most important civil rights cases in recent years, the Supreme Court decided that Congress has constitutional power to earmark Federal funds for minority groups to compensate for discrimination. In rejecting, by a 6 to 3 vote, an appeal of a decision upholding a 1977 law allocating 10 percent of a public works appropriation to minority contractors, the Court said Congress may favor a minority group whenever it finds racial discrimination and tailor the remedy to end that discrimination. The Court said that the findings of discrimination need not be as specific as when a judge imposes a remedy and that the people adversely affected by corrective programs need not have been found guilty of discrimination. (See "Significant Decisions in Labor Cases," September 1980, pp. 54–56.)

Kahn denounces construction agreements

Construction settlements in California drew attention as a number of unions negotiated 3-year contracts that, according to industry officials, would raise labor costs by more than 40 percent. Alfred E. Kahn, chairman of the Council on Wage and Price Stability, denounced these settlements—and some others in the industry—as inflationary and called on John T. Dunlop, head of the tripartite Pay Advisory Committee, to investigate the problem. Dunlop immediately began discussions with construction industry and union leaders to determine if 1980 settlements alter traditional wage relationships between the various crafts and, thus, create competition among crafts. During his tenure as leader of the former Construction Industry Stabilization Committee, Dunlop worked to stabilize these pay relationships as part of his plan to moderate construction settlements.

Perhaps the most noteworthy settlement was between Plumbers District Council 16 and the various employer associations for 12,000 workers in a 13 county area, including Los Angeles. It provided for an $8.85 increase in the previous $20-an-hour wage-benefit cost. Wages were increased to $15.25 an hour on July 1, 1980 (from $13.83), to $16.85 on July 1, 1981, and to $18.69 on July 1, 1982. The balance of the package consisted of increases in employer payments into various benefit funds and increases in travel pay and subsistence.

William Deel, head of the Plumbing Contractors Association, said that the association was forced to settle on the $8.85 package because 500 independent companies continued to work during the 2-week strike, putting the 180 companies in the association at a competitive disadvantage. According to Deel, the independent companies, which employ 7,000 of the 12,000 workers, had signed interim agreements that bound them to accept whatever terms were negotiated by the association.

Deel indicated that the settlement may cause a trend toward nonunion construction because "the nonunion firms pay anything they want, and skimp or even skip entirely the fringe benefits, such as pensions." However, a plumbers union official said plumbers average about $20,000 a year, calling that "hardly excessive" for skilled craft workers.

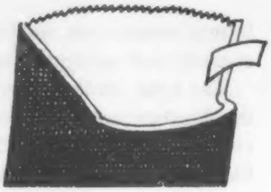
The other settlements involved a number of crafts and generally provided for $6.37 packages over the 3-year contract duration.

Insurer to yield job data

The U.S. Department of Labor withdrew a 2-day-old order barring Prudential Insurance Co. from holding Federal government contracts after the company agreed to supply the computerized employment data the Department had been seeking. The accord, worked out with the assistance of Federal District Judge Herbert Stern, provided that Prudential will supply the information regarding its employees back to July 1, 1976, on condition that the Government keep the records confidential.

The Department had been seeking the information as part of an investigation to determine if Prudential engaged in any discriminatory employment practices. Prudential had agreed to supply printouts of certain data but not the actual computer tapes, contending that this would have violated the privacy of its employees. This stalemate led to the order that would have cost Prudential more than $200 million a year in income from Government contracts.

Judge Stern, who heard Prudential's appeal of the order, scheduled a September hearing on the Department's request that Prudential also supply information for earlier years to enable it to make comparisons with the later information. Prudential contended that it was not required to supply the earlier information because it was covered by a 1976 conciliation agreement resolving previous employment matters. ☐



Book Reviews

American universities: making the grade?

American Academics: Then and Now. By Logan Wilson. New York, Oxford University Press, 1979. 309 pp. $13.95.

American Higher Education in Decline. By Kenneth H. Ashworth, foreword by Logan Wilson. College Station, Tex., Texas A & M University Press, 1979. 105 pp. $7.95.

Both distinguished educators, the authors of these books have written rather different accounts of the institutional behavior of higher education in the recent past. Logan Wilson's book, the more scholarly of the two, focuses on the people who staff the classrooms, laboratories, and offices of colleges and universities, while Kenneth H. Ashworth's essay examines the institutions of government, enterprise, and accreditation which, it claims, largely account for higher education's "decline." Though neither author dwells on economic factors, both books provide penetrating glimpses of the firms and markets which generate and channel higher education's economic activity.

Wilson's book is really a sociological profile of American academics—"then," by which Wilson means the early 1940's (when he previously analyzed the academic profession in *The Academic Man*), and "now" in the late 1970's. As in the earlier book, he begins by tracing the life cycle of an average academician as professional recruit, student, and apprentice, staff member, and "professor administrant." Progression through these stages, he observes, is basically a matter of competence rather than political or market power. Thus, in succeeding chapters, Wilson describes the ways that competence is discovered and nurtured in academia and how these processes lead to differentials in status and prestige for institutions as well as individuals.

It is the chapters on status appraisal, professional and economic status, and university and individual prestige that reveal the importance to economic understanding of mastering the sociology of the profession. One finds in universities an intellectual values structure which assumes negligible differences in the "value" of knowledge among the various fields and a commitment to the advancement of knowledge in all disciplines rather than to personal self-interest or pecuniary profit. Accordingly, faculty are judged by their intellectual quality and scholarly output rather than by the substantial differences between their market prices in nonacademic opportunities. Wilson has laced the last few chapters of the book with illustrations of how this desire for interfield equality has led to shortages and hence potential qualitative declines in specialties where opportunity wages are high, and to institutional reliance on assorted compensatory nonmonetary remuneration schemes designed to widen real incentive structures despite constraints on salaries. Thus, the devices of market adjustment are clearly evident amid the sociological trappings of the Wilson volume.

While Ashworth in *American Higher Education in Decline* does not deny the link between social organization and market performance, he implies that the link is moot so long as three institutional actors continue to undermine academia's values structure: the Federal bureaucrats who "harass" and "subjugate" higher education, the entrepreneurs of "freeze-dried" nontraditional education who, in a new version of Gresham's law, produce the least rigorous off-campus programs, and impotent regional accrediting associations which ought to know better but relax standards anyway. These three actors and their constituencies have become interdependent through Federal largess, which Ashworth argues has propelled American higher education into decline.

Fortunately, in Ashworth's view, the latest cycle of governmental interaction with higher education is drawing to a close as Federal monies for student support dry up. But a new cycle, propelled by urgent public needs for the unique services academia can provide, those services oriented more towards technological research and social understanding than to the current cycle's focus on broadened access, may be just around the corner. If so, Ashworth calls for stiffened backs and wiser choices in the halls of ivy, lest government be allowed to intervene once again into higher education's internal processes and priorities.

Ashworth's attitude towards markets for higher education services, therefore, is ambivalent: he mistrusts the allocative processes of free markets, expecially the leveling influence of entrepreneurial activity on standards of academic excellence; yet he abhors the regulatory threat of Federal and State employees who lack understanding of what a university is and how it works.

If not regulation, then what? Self-regulation, he seems to be saying, and *his* objectives in such a system would be merit at the expense of equality, and excellence at the expense of the "prevailing standard of mediocrity."

Both books are written for a general audience, though I suspect that the majority of the readers will be educators or perhaps government bureaucrats who keep files on their enemies. The Wilson book should also appeal to aspiring academicians eager to catch a glimpse of the institution to which they may be committing their life's work.

Both books add marginally to previous literature on the current academic malaise—the Wilson book primarily to the sociology of the academic profession, the Ashworth polemic to the public debate about the quality of educational outcomes. Readers should be warned that Ashworth's tell-it-like-it-is style substitutes opinion for evidence on almost every page; it will not persuade cautious readers unless they already harbor a similar set of prejudices about the roles of government, nontraditional suppliers, and standard-setting in American higher education.

The work ethic: battered but unbowed

The Work Ethic in Industrial America, 1850–1920. By Daniel T. Rodgers. Chicago, The University of Chicago Press, 1978. 300 pp. $5.95, paper.

In Daniel T. Rodgers' words, "This is at bottom a study not of work but of ideas about work." The book focuses on the question, "What happened to work values among middle-class northerners when work itself was radically remade?" The issue of the work ethic in early industrial America has obvious appeal to the student of American history, but, because of Rodgers' lucid and concise treatment of this ever controversial issue, it will perhaps reach a wider audience. Although his penetrating analysis of the relationship between workers and their machines draws from a wide-range of literary vehicles and historical figures, he tends to concentrate on a particular genre or a few influential persons in many of his chapters.

The early 19th century marked the beginning of the transformation of the American economy from an agricultural to an industrial base. However, home production, or the "putting-out" system of handmade goods, still flourished. Thus, work was still primarily autonomous and associated with self-fulfillment and personal independence. By the mid-19th century, disparate strands of view, some of which were rooted in the Protestant Reformation and others in the era of the American Revolution, all came together to reaffirm that work was the core of moral life. "Work made men useful in a world of economic scarcity; it staved off the doubts and temptations that preyed on idleness; it opened the way to deserved wealth and status; it allowed one to put the impress of mind and skill on the material world."

Industrialization drove an unbridgeable void between the notion of work for self-fulfillment and work for monetary gain. The debasing and monotonous nature of factory work, together with the issue of wage employment, led to continuous worker efforts, most of which failed, to render industrial toil more humane. "From the cooperatives' attack on hireling wage labor, to the progressive moralists' campaign against factory monotony, to the restless discontent of industrial workers, northerners had tilted against the industrial regime, where time and discipline were screwed to an unfamiliar pitch, skills split and autonomy undermined." To trace these developments, Rodgers leaves no stone unturned, extracting material from sermons, lectures, children's literature, editorials, essays, poems, speeches, and cartoons. To represent the honest workingman, for example, he vividly describes the square-jawed, paper-capped, bare-armed, muscled blacksmith holding the tools of his trade—a commonplace figure of the industrial era.

"The first issue to trouble the moralist was the matter of wage working." To some wage labor seemed little different than slavery if a worker could not realistically aspire to a business of his own. Counterattacks on the wage system included the formation of cooperative workshops, profit-sharing, piecework, and finally an industrial democracy crusade (which in today's international circles would be known as "codetermination"), whereby employees and employers share in the decisionmaking process. Obviously, some of the labor issues of yesterday are still with us today. Piecework points to another example. To individualize payment, it was necessary to find precisely how long a worker should take to do a particular job. This gave birth to the still controversial time and motion studies. What bound all these causes together was an unwillingness to let go of the idea that work, if it was worthwhile, required the self-direction of the worker.

Industrial monotony drove a second wedge between work ideals and work realities and proved to be as vexing and unsettling as the question of a worker's economic freedom. In the chapter, "Mechanicalized Men," Rodgers traces the evolution of the problem and subsequent worker reactions through the works of four leading labor experts or reformers of the factory system. Carroll D. Wright, first Commissioner of the Federal Bureau of Labor in 1885, argued that factories had imposed moral order on moral chaos. In contrast, two

Englishmen—John Ruskin and William Morris—advocated abandoning or severely restricting the machine. This attack eventually led to the short-lived handicraft movement—arts and crafts societies fashioning their wares by hand. Ultimately, Jane Addams concluded that, since machines were inviolable, factory workers might become more happily adjusted if they knew their work was part of something larger. She started the "industrial betterment movement," with teamwork as the dominant motif. This led to a turn-of-the century surge in industrial education based on the notion that monotony could be conquered by proper mental preparation. However, against Addams protests, the schools were refashioned along factory lines, and classes were job-focused rather than worker-focused. "So the critics of routinized work turned at last toward leisure."

"Vacations were a new habit for the suburban middle class in the 1850's." In the chapter, "Play, Repose, and Plenty," Rodgers analyzes 19th century theorizing on rest, relaxation, and consumption. *Play* and recreation are praised by American ministers, most notably Henry Ward Beecher, as an offsetting influence to the excesses of work. As an alternative to play, a growing library of books advocated the power of *repose* to rekindle the mind or to regenerate spiritually troubled souls. *Plenty* refers to the age-old argument that overproduction and underconsumption would result in supply outrunning demand, leading to a general economic glut. This led to the thinking, that still somewhat besets us today, that "the best cure for national impoverishment was not to tighten one's belt but to let it out a notch" and consume. An era of surplus had arrived.

The erosion of the scarcity ideology was the most evident sign of a shift in values. "Yet the striking phenomenon of the age was not change but persistence amid change," the endurance of the work ethic, but a work ethic more and more independent from work itself. Rodgers tracks a splintering of the old phrases and old homilies associated with work ideals from the rolling confusion of everyday life through stories written for boys growing up in the 19th- and early 20th-century America. These tales intertwined lessons of work and discipline. Although they moved from instruction to instruction-within-amusement, from stories of work to stories of play and heroic endeavor, the code of duty among heroes endured; a faith in work survived.

There was still the question of "How much of a man's life should work consume?" In a somewhat less provocative chapter, "Sons of Toil," Rodgers documents the clashes between employer and employee over worktime. Workers relief from toil was manifested in absenteeism, quits, slowdowns, and a call for a shorter than a sun-to-sun workday. Shouts of "a fair day's wage and a fair day's work" became the commonplace cry of the land.

The final chapters deviate from Rodgers' chronological organization scheme to cover the work ethic with regard, first to women, and then to political rhetoric. "We also shall have our share of honored and socially useful toil," says Olive Schreiner in ***Women and Labor*** (1911). The theme that binds two influential women of the time—Harriet Beecher Stowe and Charlotte Perkins Gilman, who stand at either end of the industrial years and view women's status differently—is their repeated insistence on work. Stowe saw work as a way to break down the conventions that often forced single women into marriage. Gilman argued that women's economic dependence on men was catastrophic, stifling their independence, and the only solution was for women to go to work. However, feminist versions of the work ethic were never more than a single strand of thread in the tangled debate over the status of women. By the early 20th century, the issue of women working outside the home was no longer in doubt among many feminists. Rodgers' retrospective prediction, "To turn women's restlessness into a demand for work was to tap an immense reservoir of moral feeling, perhaps the largest that lay open to 19th and 20th century feminists," has indeed been borne out. Although women have entered the work force in record numbers throughout the post-World War II era, they have only recently begun to make inroads into male-dominated occupations.

Beggars and millionaires, who they were and whence came their unearned incomes, were matters that divided turn-of-the century northerners into bitterly contending political camps. Rodgers details the evolution of this struggle in "Political Uses of the Work Rhetoric." An epilogue that discusses Charles W. Eliot's writings—concerned with work and the conditions both of mind and circumstance that made work a rewarding, energizing, joyful activity, or otherwise—concludes the book.

Today, the work ethic may be reflected in what is called the "linear life plan," a progression from school in youth, through work during the middle years, to retirement in the later years. (See the Fred Best-Barry Stern article in the July 1977 issue of the *Review.*) It is argued, however, that—given the tremendous changes that have occurred in our society, such as the increases in education, technology, and life expectancy—such a plan may no longer fit, or be optimal for, many workers. More workers than ever before want direct personal involvement in determining when and how they will work. Ergo, the conflict over the work/leisure issue persists as workers continue to strive for more freedom of choice; Rodgers has given us an insightful historical perspective to this struggle.

Education as an escape from the ghetto

The Education of Black Philadelphia: The Social and Educational History of a Minority Community, 1900–1950. By Vincent P. Franklin. Philadelphia, University of Pennsylvania Press, 1979. 298 pp. $19.95.

Vincent P. Franklin has written the first historical and social study of education in black Philadelphia, between 1900 and 1950, within the changing social, political, and economic context of the black minority. From the perspective of the black community, the major purpose of public and community educational activities was the advancement of Afro-Americans in the city. Education was perceived as an important vehicle for improving the depressed conditions of black citizens caused by discrimination in employment, housing, and public accommodations. Community educational programs were also geared toward those problems facing the black population. Black leaders, parents, and educators struggled persistently to ensure that the schooling that was made available to black children and adults at public expense also functioned to bring about improvements in the overall social status of black Philadelphians.

The first part of this book concentrates on the period from the turn of the century and the publication of W. E. B. DuBois' *The Philadelphia Negro (1899) to the Onset of the Great Depression.* In chapter 1, Franklin discusses the origins and development of the Philadelphia black community in the 18th and 19th centuries and presents a detailed examination of social conditions prior to 1920, especially the impact of the Great Migration. Chapter 2 examines public and private schooling of black Philadelphians in the 19th and early 20th centuries. The progressive education movement had a significant effect on public education in Philadelphia as school officials attempted to come to grips with the problem of increasing black and immigrant enrollments. According to the author, the increase in public school segregation in the wake of the Great Migration led in the 1920's to a campaign by members of the black community to change official school board policies and practices. Chapter 3 examines the social, political, economic, and educational conditions in black Philadelphia during the 1920's, and describes the unsuccessful campaign to end the practice of segregating black students and teachers in the public school system. The lack of black political power in the city meant that demands for desegregation of public schools would not be met in that decade.

Various historical and literary societies, church and fraternal groups, and social improvement associations organized communitywide educational activities to inform black Philadelphians about their heritage and contemporary social issues and problems. Chapter 4 presents an analysis of the educational programs that flourished between 1900 and 1930.

In Part II, the author discusses the effect of the Great Depression, New Deal, World War II, and changing race relations on black Philadelphia. The economic depression of the 1930's caused even greater poverty and discrimination against blacks in the local and national job market. Chapter 5 examines the social, economic, and political changes for black Philadelphia during the decade. The reemergence of the Democratic Party in Philadelphia during the early 1930's led to increased competition between the two major parties for the large black vote. Chapter 6 details the successful campaign for the appointment of a black to the school board and the official desegregation of the public school system. The increase in black political power was extremely important in bringing about a change in the policies of the politically appointed Board of Public Education.

The national defense mobilization in the late 1930's signaled the beginning of a major shift in black-white, majority-minority relations in the United States. In Philadelphia, the increased demand for skilled workers led to the training and hiring of blacks in areas where they were previously barred. Chapter 7 describes race relations in Philadelphia in the 1930's and 1940's and the campaigns to educate black and white citizens in order to bring about greater interracial cooperation and understanding. Chapter 8 examines conditions in the public secondary schools of the city and the vocational training available to black youths. In the last chapter, Franklin examines the question of change and continuity in the social and educational conditions of black Philadelphia.

In this reviewer's opinion, it is important to note that other racial, religious, and cultural minority groups have been the victims of discrimination and have used public schooling and community educational programs to improve their socioeconomic conditions.

This study is richly researched and should take its place along such classic studies as: Cronin, *The Control of Urban Schools* (1973); Drake, *St. Clair Black Metropolis* (1945); Huggins, *Harlem Renaissance* (1971); Lyman, *The Black American in Sociological Thought* (1972); Spear, *Black Chicago* (1967); and Tyack, *One Best System* (1974).

It is the author's hope that this study will stimulate other comparative analyses of the social and educational history of racial and cultural minorities in urban America.

Three quiet revolutionaries

Moving the Mountain: Women Working for Social Change. By Ellen Cantarow with Susan Gushee O'Malley and Sharon Hartman Strom. Old Westbury, N.Y., The Feminist Press, 1980. 166 pp., bibliography, $4.75, paper.

Underlying every movement for social reform is a "second echelon" of leadership—the unacclaimed men and women who work behind the scenes to achieve the changes advocated by their more visible colleagues. Ellen Cantarow, Susan Gushee O'Malley, and Sharon Hartman Strom attempt to give credit where credit is due by profiling the careers of three remarkable but little known American activists: suffragette and labor leader Florence Luscomb, civil rights activist Ella Baker, and United Farm Workers organizer Jessie Lopex de la Cruz. All three have participated in an impressive array of progressive organizations and their contributions to their respective causes are, as this book reveals, quite substantial.

To give the reader a greater feeling for these women and their work, the authors have fashioned an "oral history" of the life and times of their subjects. After each woman is sketched in a brief historical and biographical introduction, the story is turned over to the inverviewee who reflects on her years of activism. Comments by the authors interspersed with the narrative put these recollections into historical perspective.

Has this innovative approach to biography worked? It has certainly succeeded in drawing colorful and evocative portraits of three delightfully feisty women. Florence Luscomb, born in 1877 to a wealthy Lowell, Mass. family, traces her activism back to the early suffrage movement. She organized the first union for clerical workers in 1937, ran for Congress and the governorship of Massachusetts, and wrote the first anti-Vietman war pamphlet that appeared in Massachusetts in 1953. She emerges as a reformer in the grand New England tradition: genteel and steely, prim and powerful, she relinquished the privileges of her upper-class background to participate in working-class movements.

Ella Baker, now 77, started her career with an editorial position on the black newspaper *American West Indian News.* In 1938, she began her lifelong association with the National Association for the Advancement of Colored People (NAACP), becoming president of the New York City branch in 1954. In the early sixties, she midwifed the birth of the Student Nonviolent Coordinating Committees (SNCC) and worked extensively with the Southern Christian Leadership Conference. She appears as a woman of quiet strength whose activism is tempered by a self-effacing view of her contributions: "The kind of role I tried to play was to pick up pieces or put together pieces out of which I hoped an organization might come. My theory is, strong people don't need strong leaders."

A visit from Cesar Chavez in 1962 got California-born Jessie Lopex de la Cruz involved in *La Causa*—the efforts to organize migrant farmworkers into a union. By 1967, she had become an official union organizer. The 59-year old de la Cruz now works with her husband and family on a cooperative ranch and is actively engaged in trying to break the power of the corporate growers in the San Joaquin Valley and open the land to small farmers. As these women relate their experiences, the reader grasps something of the inner fire that animates them and their efforts to achieve social reform.

Unfortunately, the editorial commentary does not match the quality of the interviewees' narrative. The authors' enthusiasm and respect for their subjects make this book a lively and readable history, but their admiration overwhelms them on occasion, resulting in an embarrassment of gushing prose. Clichés such as "legendary activist" and "passion for justice," and observations like "It took courage to oppose the Cold War" become tedious and dehumanizing. The three activists might have been better served, and their accomplishments more creditably described in an understated and less partisan style.

A more serious flaw is the authors' tendency to oversimplify historical analysis. Objectivity is sacrificed for polemic and rhetoric, and at times, the tone becomes almost sophomoric. Complex historical developments like the Cold War, the Depression, and the Civil Rights Movement are explained only in the most simplistic terms; little effort is made to give a thoughtful accounting of the social forces behind the events. For example, the Cold War is dismissed in a single sentence as a systematic attack by the United States on the Soviet Union, China, and Western European Communist parties; the Depression is described as a frenzied attempt by big business to expand by overinvesting. One appreciates the authors' wish to keep their own comments brief, but such brevity may not be appropriate to a discussion of intricate social issues.

Despite these drawbacks, the book does achieve its declared goals: it brings to light the contributions of three dynamic reformers whose work has not received the general recognition it deserves. This sharing in the feelings and experiences of those who stand just behind the noisy vanguard of social reform gives the reader a greater appreciation of the patience, courage, and determination required to bring about reform.

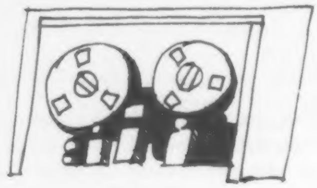
Organizing to preserve wages

. . . The immigrant is, in the first instance, a wage-reducer, either directly or indirectly, although the extent of his influence upon wages can not well be stated; but as a prospective wage-reducer he is met by the trade union in self-defense, just as the trade union meets female and child labor, except in this, the union seeks to organize the immigrants, while it seeks by legislation to prohibit or limit the work of women and children—that is, the union seeks the aid of the state to prevent wage reductions by means of female and child labor, and it seeks by organizing the immigrants to prevent reduction of wages by immigration.

—Carroll D. Wright
"Influence of Trade Unions on Immigrants,"
Bulletin of the Bureau of Labor,
January 1905, No. 56, p. 1.

Current Labor Statistics



Notes on Current Labor Statistics 66

Schedule of release dates for major BLS statistical series 66

Employment data from household survey. Definitions and notes 67

1. Employment status of noninstitutional population, selected years, 1950–79 67
2. Employment status by sex, age, and race, seasonally adjusted 68
3. Selected employment indicators, seasonally adjusted 69
4. Selected unemployment indicators, seasonally adjusted 70
5. Unemployment rates, by sex and age, seasonally adjusted 71
6. Unemployed persons, by reason for unemployment, seasonally adjusted 71
7. Duration of unemployment, seasonally adjusted 71

Employment, hours, and earnings data from establishment surveys. Definitions and notes 72

8. Employment by industry, 1950–79 73
9. Employment by State 73
10. Employment by industry division and major manufacturing group 74
11. Employment by industry division and major manufacturing group, seasonally adjusted 75
12. Labor turnover rates in manufacturing, 1977 to date 76
13. Labor turnover rates in manufacturing, by major industry group 76
14. Hours and earnings, by industry division, 1949–79 77
15. Weekly hours, by industry division and major manufacturing group 78
16. Weekly hours, by industry division and major manufacturing group, seasonally adjusted 79
17. Hourly earnings, by industry division and major manufacturing group 80
18. Hourly Earnings Index, by industry division, seasonally adjusted 80
19. Weekly earnings, by industry division and major manufacturing group 81
20. Gross and spendable weekly earnings, in current and 1967 dollars, 1960 to date 82

Unemployment insurance data. Definitions and notes 83

21. Unemployment insurance and employment service operations 83

Price data. Definitions and notes 84

22. Consumer Price Index, 1967–79 85
23. Consumer Price Index, U.S. city average, general summary and selected items 85
24. Consumer Price Index, cross classification of region and population size class 91
25. Consumer Price Index, selected areas 92
26. Producer Price Indexes, by stage of processing 93
27. Producer Price Indexes, by commodity groupings 94
28. Producer Price Indexes, for special commodity groupings 96
29. Producer Price Indexes, by durability of product 96
30. Producer Price Indexes for the output of selected SIC industries 96

Productivity data. Definitions and notes 99

31. Annual indexes of productivity, hourly compensation, unit costs, and prices, 1950–79 99
32. Annual changes in productivity, hourly compensation, unit costs, and prices, 1969–79 100
33. Quarterly indexes of productivity, hourly compensation, unit costs, and prices, seasonally adjusted 100
34. Percent change from preceding quarter and year in productivity, hourly compensation, unit costs, and prices 101

Labor-management data. Definitions and notes 102

35. Wage and benefit settlements in major collective bargaining units, 1975 to date 102
36. Effective wage rate adjustments going into effect in major collective bargaining units, 1975 to date 103
37. Work stoppages, 1947 to date 103

NOTES ON CURRENT LABOR STATISTICS

This section of the *Review* presents the principal statistical series collected and calculated by the Bureau of Labor Statistics. A brief introduction to each group of tables provides definitions, notes on the data, sources, and other material usually found in footnotes.

Readers who need additional information are invited to consult the BLS regional offices listed on the inside front cover of this issue of the *Review*. Some general notes applicable to several series are given below.

Seasonal adjustment. Certain monthly and quarterly data are adjusted to eliminate the effect of such factors as climatic conditions, industry production schedules, opening and closing of schools, holiday buying periods, and vacation practices, which might otherwise mask short-term movements of the statistical series. Tables containing these data are identified as "seasonally adjusted." Seasonal effects are estimated on the basis of past experience. When new seasonal factors are computed each year, revisions may affect seasonally adjusted data for several preceding years. For a technical discussion of the method used to make seasonal adjustments, see *X-11 Variant of the Census Method II Seasonal Adjustment Program*, Technical Paper No. 15 (Bureau of the Census, 1967).

Seasonally adjusted labor force data in tables 2-7 were last revised in the February 1980 issue of the *Review* to reflect the preceding year's experience. Beginning in January 1980, the BLS introduced two major modifications in the seasonal adjustment methodology for labor force data. First, the data are being seasonally adjusted with a new procedure called X-11/ARIMA, which was developed at Statistics Canada as an extension of the standard X-11 method. A detailed description of the procedure appears in *The X-11 ARIMA Seasonal Adjustment Method* by Estela Bee Dagum (Statistics Canada Catalogue No. 12-564E, September 1979). The second change is that seasonal factors are now being calculated for use during the first 6 months of the year, rather than for the entire year, and then are calculated at mid-year for the July-December period. Revisions of historical data continue to be made only at the end of each calendar year.

Annual revision of the seasonally adjusted payroll data in tables 11, 13, 16, and 18 begins with the August 1980 issue using the X-11 ARIMA seasonal adjustment methodology. New seasonal factors for productivity data in tables 33 and 34 are usually introduced in the September issue. Seasonally adjusted indexes and percent changes from month to month and from quarter to quarter are published for numerous Consumer and Producer Price Index series. However, seasonally adjusted indexes are not published for the U.S. average All Items CPI. Only seasonally adjusted percent changes are available for this series.

Adjustments for price changes. Some data are adjusted to eliminate the effect of changes in price. These adjustments are made by dividing current dollar values by the Consumer Price Index or the appropriate component of the index, then multiplying by 100. For example, given a current hourly wage rate of \$3 and a current price index number of 150, where 1967 = 100, the hourly rate expressed in 1967 dollars is \$2 (\$3/150 × 100 = \$2). The resulting values are described as "real," "constant," or "1967" dollars.

Availability of information. Data that supplement the tables in this section are published by the Bureau of Labor Statistics in a variety of sources. Press releases provide the latest statistical information published by the Bureau; the major recurring releases are published according to the schedule given below. The *Handbook of Labor Statistics 1978*, Bulletin 2000, provides more detailed data and greater historical coverage for most of the statistical series presented in the *Monthly Labor Review*. More information from the household and establishment surveys is provided in *Employment and Earnings*, a monthly publication of the Bureau, and in two comprehensive data books issued annually—*Employment and Earnings, United States* and *Employment and Earnings, States and Areas*. More detailed information on wages and other aspects of collective bargaining appears in the monthly periodical, *Current Wage Developments*. More detailed price information is published each month in the periodicals, the *CPI Detailed Report* and *Producer Prices and Price Indexes*.

Symbols

p = preliminary. To improve the timeliness of some series, preliminary figures are issued based on representative but incomplete returns.

r = revised. Generally this revision reflects the availability of later data but may also reflect other adjustments.

n.e.c. = not elsewhere classified.

Schedule of release dates for major BLS statistical series

Title and frequency (monthly except where indicated)	Release date	Period covered	Release date	Period covered	MLR table number
Employment situation	October 3	September	November 7	October	1 - 11
Producer Price Index	October 3	September	November 7	October	26 - 30
Consumer Price Index	October 24	September	November 25	October	22 - 25
Real earnings	October 24	September	November 25	October	14 - 20
Productivity and costs (quarterly)					
Nonfarm business and manufacturing	October 27	3d quarter			31 - 34
Nonfinancial corporations			November 26	3d quarter	31 - 34
Major collective bargaining settlements (quarterly)	October 27	1st 9 months			35 - 36
Work stoppages	October 28	September	November 28	October	37
Labor turnover in manufacturing	October 30	September	November 28	October	12 - 13

EMPLOYMENT DATA FROM THE HOUSEHOLD SURVEY

EMPLOYMENT DATA in this section are obtained from the Current Population Survey, a program of personal interviews conducted monthly by the Bureau of the Census for the Bureau of Labor Statistics. The sample consists of about 65,000 households beginning in January 1980, selected to represent the U.S. population 16 years of age and older. Households are interviewed on a rotating basis, so that three-fourths of the sample is the same for any 2 consecutive months.

Definitions

Employed persons are (1) those who worked for pay any time during the week which includes the 12th day of the month or who worked unpaid for 15 hours or more in a family-operated enterprise and (2) those who were temporarily absent from their regular jobs because of illness, vacation, industrial dispute, or similar reasons. A person working at more than one job is counted only in the job at which he or she worked the greatest number of hours.

Unemployed persons are those who did not work during the survey week, but were available for work except for temporary illness and had looked for jobs within the preceding 4 weeks. Persons who did not look for work because they were on layoff or waiting to start new jobs within the next 30 days are also counted among the unemployed. The **unemployment rate** represents the number unemployed as a percent of the civilian labor force.

The **civilian labor force** consists of all employed or unemployed persons in the civilian noninstitutional population; the **total labor force** includes military personnel. Persons **not in the labor force** are those not classified as employed or unemployed; this group includes persons retired, those engaged in their own housework, those not working while attending school, those unable to work because of longterm illness, those discouraged from seeking work because of personal or job market factors, and those who are voluntarily idle. The **noninstitutional population** comprises all persons 16 years of age and older who are not inmates of penal or mental institutions, sanitariums, or homes for the aged, infirm, or needy.

Full-time workers are those employed at least 35 hours a week; **part-time workers** are those who work fewer hours. Workers on part-time schedules for economic reasons (such as slack work, terminating or starting a job during the week, material shortages, or inability to find full-time work) are among those counted as being on full-time status, under the assumption that they would be working full time if conditions permitted. The survey classifies unemployed persons in full-time or part-time status by their reported preferences for full-time or part-time work.

Notes on the data

From time to time, and especially after a decennial census, adjustments are made in the Current Population Survey figures to correct for estimating errors during the preceding years. These adjustments affect the comparability of historical data presented in table 1. A description of these adjustments and their effect on the various data series appear in the Explanatory Notes of *Employment and Earnings*.

Data in tables 2–7 are seasonally adjusted, based on the seasonal experience through December 1979.

1. Employment status of the noninstitutional population, 16 years and over, selected years, 1950–79

[Numbers in thousands]

Year	Total non-institutional population	Total labor force		Civilian labor force						Not in labor force

EMPLOYMENT, HOURS, AND EARNINGS DATA FROM ESTABLISHMENT SURVEYS

EMPLOYMENT, HOURS, AND EARNINGS DATA in this section are compiled from payroll records reported monthly on a voluntary basis to the Bureau of Labor Statistics and its cooperating State agencies by 166,000 establishments representing all industries except agriculture. In most industries, the sampling probabilities are based on the size of the establishment; most large establishments are therefore in the sample. (An establishment is not necessarily a firm; it may be a branch plant, for example, or warehouse.) Self-employed persons and others not on a regular civilian payroll are outside the scope of the survey because they are excluded from establishment records. This largely accounts for the difference in employment figures between the household and establishment surveys.

LABOR TURNOVER DATA in this section are compiled from personnel records reported monthly on a voluntary basis to the Bureau of Labor Statistics and its cooperating State agencies. A sample of 40,000 establishments represents all industries in the manufacturing and mining sectors of the economy.

Definitions

Employed persons are all persons who received pay (including holiday and sick pay) for any part of the payroll period including the 12th of the month. Persons holding more than one job (about 5 percent of all persons in the labor force) are counted in each establishment which reports them.

Production workers in manufacturing include blue-collar worker supervisors and all nonsupervisory workers closely associated with production operations. Those workers mentioned in tables 14–20 include production workers in manufacturing and mining; construction workers in construction; and nonsupervisory workers in transportation and public utilities, in wholesale and retail trade, in finance, insurance, and real estate, and in services industries. These groups account for about four-fifths of the total employment on private nonagricultural payrolls.

Earnings are the payments production or nonsupervisory workers receive during the survey period, including premium pay for overtime or late-shift work but excluding irregular bonuses and other special payments. **Real earnings** are earnings adjusted to eliminate the effects of price change. The **Hourly Earnings Index** is calculated from average hourly earnings data adjusted to exclude the effects of two types of changes that are unrelated to underlying wage-rate developments: fluctuations in overtime premiums in manufacturing (the only sector for which overtime data are available) and the effects of changes and seasonal factors in the proportion of workers in high-wage and low-wage industries. **Spendable earnings** are earnings from which estimated social security and Federal income taxes have been deducted. The Bureau of Labor Statistics computes spendable earnings from gross weekly earnings for only two illustrative cases: (1) a worker with no dependents and (2) a married worker with three dependents.

Hours represent the average weekly hours of production or nonsupervisory workers for which pay was received and are different from standard or scheduled hours. **Overtime hours** represent the portion of gross average weekly hours which were in excess of regular hours and for which overtime premiums were paid.

Labor turnover is the movement of all wage and salary workers from one employment status to another. **Accession rates** indicate the average number of persons added to a payroll in a given period per 100 employees; **separation rates** indicate the average number dropped from a payroll per 100 employees. Although month-to-month changes in employment can be calculated from the labor turnover data, the results are not comparable with employment data from the employment and payroll survey. The labor turnover survey measures changes during the calendar month while the employment and payroll survey measures changes from midmonth to midmonth.

Notes on the data

Establishment data collected by the Bureau of Labor Statistics are periodically adjusted to comprehensive counts of employment (called "benchmarks"). The latest complete adjustment was made with the release of June 1980 data, published in the August 1980 issue of the *Review*. Consequently, data published in the *Review* prior to that issue are not necessarily comparable to current data. Complete comparable historical unadjusted and seasonally adjusted data are published in a Supplement to Employment and Earnings (unadjusted data from April 1977 through March 1980 and seasonally adjusted data from January 1974 through March 1980) and in *Employment and Earnings, United States, 1909–78*, BLS Bulletin 1312–11 (for prior periods).

Data on recalls were shown for the first time in tables 12 and 13 in the January 1978 issue of the *Review*. For a detailed discussion of the recalls series, along with historical data, see "New Series on Recalls from the Labor Turnover Survey," *Employment and Earnings*, December 1977, pp. 10–19.

A comprehensive discussion of the differences between household and establishment data on employment appears in Gloria P. Green, "Comparing employment estimates from household and payroll surveys," *Monthly Labor Review*, December 1969, pp. 9–20. See also *BLS Handbook of Methods for Surveys and Studies*, Bulletin 1910 (Bureau of Labor Statistics, 1976).

The formulas used to construct the spendable average weekly earnings series reflect the latest provisions of the Federal income tax and social security tax laws. For the spendable average weekly earnings formulas for the years 1978–80, see *Employment and Earnings*, March 1980, pp. 10–11. Real earnings data are adjusted using the Consumer Price Index for Urban Wage Earners and Clerical Workers (CPI-W).

NOTE: The earnings expressed in 1967 dollars have been adjusted for changes in price level as measured by the Bureau's Consumer Price Index for Urban Wage Earners and Clerical Workers. These series are described in "The Spendable Earnings Series: A Technical Note on its Calculation," **Employment and Earnings and Monthly Report on the Labor Force**, February 1969, pp. 6–13. See also "Spendable Earnings Formulas, 1978–80," **Employment and Earnings**, March 1980, pp. 10–11.

UNEMPLOYMENT INSURANCE DATA

UNEMPLOYMENT INSURANCE DATA are compiled monthly by the Employment and Training Administration of the U.S. Department of Labor from records of State and Federal unemployment insurance claims filed and benefits paid. Railroad unemployment insurance data are prepared by the U.S. Railroad Retirement Board.

Definitions

Data for **all programs** represent an unduplicated count of insured unemployment under State programs, Unemployment Compensation for Ex-Servicemen, and Unemployment Compensation for Federal Employees, and the Railroad Insurance Act.

Under both State and Federal unemployment insurance programs for civilian employees, insured workers must report the completion of at least 1 week of unemployment before they are defined as unemployed. Persons not covered by unemployment insurance (about one-third of the labor force) and those who have exhausted or not yet earned benefit rights are excluded from the scope of the survey. **Initial claims** are notices filed by persons in unemployment insurance programs to indicate they are out of work and wish to begin receiving compensation. A claimant who continued to be unemployed a full week is then counted in the insured unemployment figure. The **rate of insured unemployment** expresses the number of insured unemployed as a percent of the average insured employment in a 12-month period.

An **application** for benefits is filed by a railroad worker at the beginning of his first period of unemployment in a benefit year; no application is required for subsequent periods in the same year. **Number of payments** are payments made in 14-day registration periods. The **average amount of benefit payment** is an average for all compensable periods, not adjusted for recovery of overpayments or settlement of underpayments. However, **total benefits** paid have been adjusted.

21. Unemployment insurance and employment service operations

[All items except average benefits amounts are in thousands]

[1] Initial claims and State insured unemployment include data under the program for Puerto Rican sugarcane workers.

[2] Includes interstate claims for the Virgin Islands. Excludes transition claims under State programs.

[3] Excludes data on claims and payments made jointly with other programs.

[4] Includes the Virgin Islands. Excludes data on claims and payments made jointly with State programs.

[5] Cumulative total for fiscal year (October 1 - ps.6 September 30).

NOTE: Data for Puerto Rico included. Dashes indicate data not available.

PRICE DATA

PRICE DATA are gathered by the Bureau of Labor Statistics from retail and primary markets in the United States. Price indexes are given in relation to a base period (1967 = 100, unless otherwise noted).

Definitions

The **Consumer Price Index** is a monthly statistical measure of the average change in prices in a fixed market basket of goods and services. Effective with the January 1978 index, the Bureau of Labor Statistics began publishing CPI's for two groups of the population. One index, a new CPI for All Urban Consumers, covers 80 percent of the total noninstitutional population; and the other index, a revised CPI for Urban Wage Earners and Clerical Workers, covers about half the new index population. The All Urban Consumers index includes, in addition to wage earners and clerical workers, professional, managerial, and technical workers, the self-employed, short-term workers, the unemployed, retirees, and others not in the labor force.

The CPI is based on prices of food, clothing, shelter, fuel, drugs, transportation fares, doctor's and dentist's fees, and other goods and services that people buy for day-to-day living. The quantity and quality of these items is kept essentially unchanged between major revisions so that only price changes will be measured. Prices are collected from over 18,000 tenants, 24,000 retail establishments, and 18,000 housing units for property taxes in 85 urban areas across the country. All taxes directly associated with the purchase and use of items are included in the index. Because the CPI's are based on the expenditures of two population groups in 1972–73, they may not accurately reflect the experience of individual families and single persons with different buying habits.

Though the CPI is often called the "Cost-of-Living Index," it measures only price change, which is just one of several important factors affecting living costs. Area indexes do not measure differences in the level of prices among cities. They only measure the average change in prices for each area since the base period.

Producer Price Indexes measure average changes in prices received in primary markets of the United States by producers of commodities in all stages of processing. The sample used for calculating these indexes contains about 2,800 commodities and about 10,000 quotations per month selected to represent the movement of prices of all commodities produced in the manufacturing, agriculture, forestry, fishing, mining, gas and electricity, and public utilities sectors. The universe includes all commodities produced or imported for sale in commercial transactions in primary markets in the United States.

Producer Price Indexes can be organized by stage of processing or by commodity. The stage of processing structure organizes products by degree of fabrication (that is, finished goods, intermediate or semifinished goods, and crude materials). The commodity structure organizes products by similarity of end-use or material composition.

To the extent possible, prices used in calculating Producer Price Indexes apply to the first significant commercial transaction in the United States, from the production or central marketing point. Price data are generally collected monthly, primarily by mail questionnaire. Most prices are obtained directly from producing companies on a voluntary and confidential basis. Prices generally are reported for the Tuesday of the week containing the 13th day of the month.

In calculating Producer Price Indexes, price changes for the various commodities are averaged together with implicit quantity weights representing their importance in the total net selling value of all commodities as of 1972. The detailed data are aggregated to obtain indexes for stage of processing groupings, commodity groupings, durability of product groupings, and a number of special composite groupings.

Price indexes for the output of selected SIC industries measure average price changes in commodities produced by particular industries, as defined in the *Standard Industrial Classification Manual 1972* (Washington, U.S. Office of Management and Budget, 1972). These indexes are derived from several price series, combined to match the economic activity of the specified industry and weighted by the value of shipments in the industry. They use data from comprehensive industrial censuses conducted by the U.S. Bureau of the Census and the U.S. Department of Agriculture.

Notes on the data

Beginning with the May 1978 issue of the *Review*, regional CPI's cross classified by population size, were introduced. These indexes will enable users in local areas for which an index is not published to get a better approximation of the CPI for their area by using the appropriate population size class measure for their region. The cross-classified indexes will be published bimonthly. (See table 24.)

For further details about the new and the revised indexes and a comparison of various aspects of these indexes with the old unrevised CPI, see *Facts About the Revised Consumer Price Index*, a pamphlet in the Consumer Price Index Revision 1978 series. See also *The Consumer Price Index: Concepts and Content Over the Years*, Report 517, revised edition (Bureau of Labor Statistics, May 1978).

For interarea comparisons of living costs at three hypothetical standards of living, see the family budget data published in the *Handbook of Labor Statistics, 1977*, Bulletin 1966 (Bureau of Labor Statistics, 1977), tables 122–133. Additional data and analysis on price changes are provided in the *CPI Detailed Report* and *Producer Prices and Price Indexes*, both monthly publications of the Bureau.

As of January 1976, the Wholesale Price Index (as it was then called) incorporated a revised weighting structure reflecting 1972 values of shipments. From January 1967 through December 1975, 1963 values of shipments were used as weights.

For a discussion of the general method of computing consumer, producer, and industry price indexes, see *BLS Handbook of Methods for Surveys and Studies*, Bulletin 1910 (Bureau of Labor Statistics, 1976), chapters 13–15. See also John F. Early, "Improving the measurement of producer price change," *Monthly Labor Review*, April 1978, pp. 7–15. For industry prices, see also Bennett R. Moss, "Industry and Sector Price Indexes," *Monthly Labor Review*, August 1965, pp. 974–82.

PRODUCTIVITY DATA

Productivity data are compiled by the Bureau of Labor Statistics from establishment data and from estimates of compensation and output supplied by the U.S. Department of Commerce and the Federal Reserve Board.

Definitions

Output is the constant dollar gross domestic product produced in a given period. Indexes of **output per hour of labor input,** or labor productivity, measure the value of goods and services produced per hour of labor. **Compensation per hour** includes wages and salaries of employees plus employers' contributions for social insurance and private benefit plans. The data also include an estimate of wages, salaries, and supplementary payments for the self-employed, except for nonfinancial corporations, in which there are no self-employed. **Real compensation per hour** is compensation per hour adjusted by the Consumer Price Index for All Urban Consumers.

Unit labor cost measures the labor compensation cost required to produce one unit of output and is derived by dividing compensation by output. **Unit nonlabor payments** include profits, depreciation, interest, and indirect taxes per unit of output. They are computed by subtracting compensation of all persons from the current dollar gross domestic product and dividing by output. In these tables, **Unit nonlabor costs** contain all the components of unit nonlabor payments except unit profits. **Unit profits** include corporate profits and inventory valuation adjustments per unit of output.

The **implicit price deflator** is derived by dividing the current dollar estimate of gross product by the constant dollar estimate, making the deflator, in effect, a price index for gross product of the sector reported.

The use of the term "man-hours" to identify the labor component of productivity and costs, in tables 31 through 34, has been discontinued. **Hours of all persons** is now used to describe the labor input of payroll workers, self-employed persons, and unpaid family workers. **Output per all-employee hour** is now used to describe labor productivity in nonfinancial corporations where there are no self-employed.

Notes on the data

In the private business sector and the nonfarm business sector, the basis for the output measure employed in the computation of output per hour is Gross Domestic Product rather than Gross National Product. Computation of hours includes estimates of nonfarm and farm proprietor hours.

Output data are supplied by the Bureau of Economic Analysis, U.S. Department of Commerce, and the Federal Reserve Board. Quarterly manufacturing output indexes are adjusted by the Bureau of Labor Statistics to annual estimates of output (gross product originating) from the Bureau of Economic Analysis. Compensation and hours data are from the Bureau of Economic Analysis and the Bureau of Labor Statistics.

Beginning with the September 1976 issue of the *Review*, tables 31–34 were revised to reflect changeover to the new series—private business sector and nonfarm business sector—which differ from the previously published total private economy and nonfarm sector in that output imputed for owner-occupied dwellings and the household and institutions sectors, as well as the statistical discrepancy, are omitted. For a detailed explanation, see J. R. Norsworthy and L. J. Fulco, "New sector definitions for productivity series," *Monthly Labor Review*, October 1976, pages 40–42.

LABOR-MANAGEMENT DATA

MAJOR COLLECTIVE BARGAINING DATA are obtained from contracts on file at the Bureau of Labor Statistics, direct contact with the parties, and from secondary sources. Additional detail is published in *Current Wage Developments*, a monthly periodical of the Bureau. Data on work stoppages are based on confidential responses to questionnaires mailed by the Bureau of Labor Statistics to parties involved in work stoppages. Stoppages initially come to the attention of the Bureau from reports of Federal and State mediation agencies, newspapers, and union and industry publications.

Definitions

Data on wage changes apply to private nonfarm industry agreements covering 1,000 workers or more. Data on wage and benefit changes *combined* apply only to those agreements covering 5,000 workers or more. **First-year wage settlements** refer to pay changes going into effect within the first 12 months after the effective date of the agreement. **Changes over the life of the agreement** refer to total agreed upon settlements (exclusive of potential cost-of-living escalator adjustments) expressed at an average annual rate. **Wage-rate changes** are expressed as a percent of straight-time hourly earnings, while **wage and benefit changes** are expressed as a percent of total compensation.

Effective wage-rate adjustments going into effect in major bargaining units measure changes actually placed into effect during the reference period, whether the result of a newly negotiated increase, a deferred increase negotiated in an earlier year, or as a result of a cost-of-living escalator adjustment. Average adjustments are affected by workers receiving no adjustment, as well as by those receiving increases or decreases.

Work stoppages include all known strikes or lockouts involving six workers or more and lasting a full shift or longer. Data cover all workers idle one shift or more in establishments directly involved in a stoppage. They do not measure the indirect or secondary effect on other establishments whose employees are idle owing to material or service shortages.

35. Wage and benefit settlements in major collective bargaining units, 1975 to date
[In percent]

Sector and measure	Annual average					Quarterly average							
	1975	1976	1977	1978	1979	1978		1979				1980 P

How to order BLS publications

PERIODICALS

Order from (and make checks payable to) Superintendent of Documents, Washington, D.C. 20402. For foreign subscriptions, add 25 percent.

Monthly Labor Review. The oldest and most authoritative government research journal in economics and the social sciences. Current statistics, analysis, developments in industrial relations, court decisions, book reviews. $18 a year, single copy, $2.50.

Employment and Earnings. A comprehensive monthly report on employment, hours, earnings, and labor turnover by industry, area, occupation, et cetera. $22 a year, single copy $2.75.

Occupational Outlook Quarterly. A popular periodical designed to help high school students and guidance counselors assess career opportunities. $6 for four issues, single copy $1.75.

Current Wage Developments. A monthly report about collective bargaining settlements and unilateral management decisions about wages and benefits; statistical summaries. $12 a year, single copy $1.35.

Producer Prices and Price Indexes. A comprehensive monthly report on price movements of both farm and industrial commodities, by industry and stage of processing. $17 a year, single copy $2.25.

CPI Detailed Report. A monthly periodical featuring detailed data and charts on the Consumer Price Index. $15 a year, single copy $2.25.

PRESS RELEASES

The Bureau's statistical series are made available to news media through press releases issued in Washington. Many of the releases also are available to the public upon request. Write: Bureau of Labor Statistics, Washington, D.C. 20212.

Regional. Each of the Bureau's eight regional offices publishes reports and press releases dealing with regional data. Single copies available free from the issuing regional office.

BULLETINS AND HANDBOOKS

About 140 bulletins and handbooks published each year are for sale by regional offices of the Bureau of Labor Statistics (see inside front cover) and by the Superintendent of Documents, Washington, D.C. 20402. Make checks payable to the Superintendent of Documents. Among the bulletins and handbooks currently in print are these:

Occupational Outlook Handbook, 1980–81 Edition. Bulletin 2075. A useful resource supplying valuable assistance to all persons seeking satisfying and productive employment. $8, paperback; $11 cloth cover.

BLS Handbook of Labor Statistics 1978. Bulletin 2000. A 604-page volume of historical data on the major BLS statistical series. $9.50.

Handbook of Methods. Bulletin 1910. Brief technical account of each major statistical program of the Bureau of Labor Statistics. $3.50.

BLS Measures of Compensation. Bulletin 1941. An introduction to the various measures of employee compensation; describes each series, the manner in which it is developed, its uses and limitations. $2.75.

Occupational Projections and Training Data. Bulletin 2020. Presents both general and detailed information on the relationship between occupational requirements and training needs. (Updates Bulletin 1918 published in 1976.) $3.25.

Technological Change and its Labor Impact in Five Energy Industries. Bulletin 2005. A 64-page study appraising major technological change and discussing the impact of these changes on productivity and occupations over the next 5 to 10 years. $2.40.

BLS Publications, 1972–77. Bulletin 1990. A numerical listing and subject index of bulletins and reports issued by the Bureau from 1972 through 1977, supplementing Bulletin 1749, covering 1886–1971. $1.80.

International Comparisons of Unemployment. Bulletin 1979. Brings together all of the Bureau's work on international unemployment comparisons. Describes the methods of adjusting foreign unemployment rates in 8 countries to U.S. concepts. $3.50.

Productivity Indexes for Selected Industries, 1979 Edition. Bulletin 2054. A 190-page report of indexes of output, employment, and employee hours in selected industries from 1954 to 1978. This edition contains measures for three industries previously not covered, as well as components of previously published measures in 10 industries. $5.50.

Profiles of Occupational Pay: A Chartbook. Bulletin 2037. A graphic illustration of some of the factors that affect workers' earnings. This three-part presentation looks at wage variations among and within occupations and portrays characteristics of high- and low-paying urban areas and manufacturing industries. $3.50.

REPORTS AND PAMPHLETS

Single copies available free from the BLS regional offices or from the Bureau of Labor Statistics, U.S. Department of Labor, Washington, D.C. 20212.

How the Government Measures Unemployment. Report 505. A concise report providing a background for appraising developments in the area of unemployment.

Directory of BLS Studies in Industrial Relations 1960–78. Report 550. A listing of studies prepared by the Division of Industrial Relations as part of the Bureau's regular program of data collection and analysis in the field of industrial relations.

☆ U.S. GOVERNMENT PRINTING OFFICE: 1980 O— 341-258/47

MONTHLY LABOR REVIEW

U.S. Department of Labor
Bureau of Labor Statistics

. . . is the oldest, most authoritative Government journal in its field

- Articles and reports on employment, prices, wages, productivity, job safety, and economic growth
- 40 pages of current labor statistics
- Developments in industrial relations
- Significant decisions in labor cases
- Book reviews and notes
- Foreign labor developments

L 2.6:

U.S. DEPARTMENT OF LABOR
Ray Marshall, *Secretary*

BUREAU OF LABOR STATISTICS
Janet L. Norwood, *Commissioner*

The Monthly Labor Review is published by the Bureau of Labor Statistics of the U.S. Department of Labor. Communications on editorial matters should be addressed to the Editor-in-Chief, Monthly Labor Review, Bureau of Labor Statistics, Washington, D.C. 20212. Phone: (202) 523-1327.

Subscription price per year —
$18 domestic; $22.50 foreign.
Single copy $2.50.
Subscription prices and distribution policies for the Monthly Labor Review (ISSN 0098-0818) and other Government publications are set by the Government Printing Office, an agency of the U.S. Congress. Send correspondence on circulation and subscription matters (including address changes) to:
Superintendent of Documents,
Government Printing Office,
Washington, D.C. 20402

Make checks payable to
Superintendent of Documents.

The Secretary of Labor has determined that the publication of this periodical is necessary in the transaction of the public business required by law of this Department. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through October 31, 1982. Second-class postage paid at Riverdale, MD., and at additional mailing offices.

Labor Month In Review

STATISTICS IN BUREAUCRACIES. In her presidential address to the 141st meeting of the American Statistical Association, in Houston earlier this year, Margaret E. Martin focused on the role of government statistical bureaus whose principal function is to produce and summarize data for use by others. Highlights:

Concepts. A major activity of statistics bureaus is the definition of concepts, an activity that is both difficult and extremely important in much of Federal multipurpose data collection. A well-known example is the case of employment and unemployment . . . . Should one measure the number of persons at work, or jobs held, or hours spent at work? There are uses for each of these measures. It took economists and statisticians working together nearly a decade during the 1930's to, first, agree on basic concepts, and second, develop reasonably satisfactory and mutually compatible definitions of employment and unemployment—definitions that were workable in household surveys and that, with only minor changes, are still being used today, although not without continued questioning.

Another, and as yet unsettled, example is the concept of ethnicity and the problem of its definition in censuses and surveys. Social theory suggests no easy answer, usually assuming self-identification. A variety of different definitions have been used in practice: place of parents' birth, mother tongue, language spoken in the home, origin, or descent. It is not sufficient for the statistician to say that such concepts and definitions are not his or her business, that these questions belong exclusively to the subject-matter specialist.

Differences. Because data produced by Federal statistics bureaus frequently are national in scope, and therefore refer to the same universe, differences in series that ostensibly measure the same or similar phenomena are glaringly obvious.

The existence of two ostensibly similar series can be a boon as well a bane to statistical enterprise. Differences in level and change can call attention to problems, especially to nonsampling errors, and, if taken seriously, can lead to improvements in one or both series. Efforts to reconcile the two employment series, for example, led to many improvements, extensions, and additional analyses—improvements that have provided a wealth of additional information on the labor force.

Pressures for more. Another characteristic circumstance of much Federal data collection is the insistent pressure for more. Once statistical information is produced, it is generally used. And once used, pressures start building for more—more detail, greater frequency, more prompt availability. If a series is issued quarterly, it is wanted monthly, if it is national in scope, it is wanted for regions, or States, or all standard metropolitan statistical areas, or even every county (3,000) or every political entity (39,000). . . .

The quality of such efforts is limited not only by resources—budgets, statistical talent, and other inputs to the statistical operation—but also by the burden imposed on respondents. Although much of the government's paperwork burden is not for statistical purposes—tax collection, regulatory activities, provision of benefits for which applications must be filed—large-scale statistical surveys must consider the burden imposed on suppliers of data and the mounting resistance to paperwork.

Analysis. Because statistics bureaus collect data primarily for the use of others, some believe it is unreasonable to expect them to engage in substantive analysis. They may fear that such analysis might distort data collecting priorities or delay public dissemination of the data. . . .

I believe that more analysis by statistics bureaus, whether by their own staffs exclusively or in cooperation with others, would lead to improvements in the base data, to a better understanding of priorities, to better documentation of the data for use by others, and possibly to new knowledge as the result of the analysis. The close tie between analysis and data improvement is not generally understood and, indeed, is not clearly documented. Budget authorities and congressional appropriations committees are unaware of the importance of analysis in leading to improved data and also may fear that analysis would not be politically neutral. The research community is, I believe, more interested in obtaining the data for its own independent use than concerned about building up analytic strength in Federal statistics bureaus.

Dissemination. Statistics bureaus spend much time on methods of distributing their products effectively. The theoretical statistician writes a report for a research journal and typically leaves it up to others to seek out and use the results of his research. The statistical consultant has direct contact with the users of his advice. But the statistics bureau, at a greater distance from users and operating on public funds, should feel a responsibility for making data available in convenient forms and for explaining how the data are compiled, their weaknesses and strengths.

If statisticians as a profession seek wider application of statistical methods in data collection activities, in other scientific disciplines, and in management and administration, whether public or private, we may need to devote more effort to communicating with nonstatisticians in ways that are of interest and of benefit to them.

The text of Martin's address is scheduled for publication in March in the *Journal* of the American Statistical Association. □

Self-employed Americans: their number has increased

The self-employed began to more closely resemble wage and salary workers during 1972–79; their workweek was shortened, they tended to be younger, and were more likely to be women than in the past, but they continued to earn less than other workers

T. SCOTT FAIN

Between 1972 and 1979, the number of self-employed Americans rose by more than 1.1 million, reversing decades of steady decreases.[1] The most dramatic surge occurred in the post-recession years of 1976–79, when the percentage increase in the number of self-employed workers surpassed the comparable increase for wage and salary workers (12.4 versus 10.8 percent).

When agricultural self-employment is separated from nonagricultural, a more dramatic picture appears. While the number of agricultural self-employed workers continued to decline—dropping 210,000 between 1972 and 1979—nonagricultural self-employment increased by 1.3 million. The growth trend was especially strong in the last 4 years when nonagricultural self-employment rose by 17 percent, while wage and salary employment rose 11 percent. (See table 1.)

In addition to the self-employed as officially enumerated by the Census Bureau, there are three other groups closely related to this worker category. First, there are those who identify themselves as self-employed but whose businesses are incorporated. Their numbers are included with the wage and salary group. Therefore, the increase in these workers from around 850,000 in 1967 (when they were first reclassified out of the self-employed category) to more than 2 million in 1979 is not reflected in the official figures for the self-employed. A more detailed discussion of these persons comes at the end of this article after an examination of recent trends among proprietors and partners, who comprise the unincorporated self-employed.

Another type of self-employment that is not reflected in the data in table 1 involves the more than 1.5 million workers who are self-employed at their second jobs. Because these moonlighters are classified by the nature of their primary employment, they are officially wage and salary workers. Those persons who supplemented their earnings with self-employment accounted for more than

---

T. Scott Fain is an economist formerly with the Office of Current Employment Analysis, Bureau of Labor Statistics. Bernard Altschuler, a statistician in the same office, developed some of the tabulations used in this analysis.

one-third of all dual or multiple jobholders in 1979, and their number rose more than 28 percent since 1972.

On the other hand, the number of unpaid family workers, another group similar to the self-employed, continued its overall downturn. In 1979, there were 760,000 unpaid family workers, a drop of 225,000 since 1972, with the agricultural sector leading the decline. This group continues to be predominantly female, as they constituted 9 of 10 unpaid family workers in 1979.

The overall upward trend in the number of self-employed workers was interrupted during the 1974–75 recession; there were 50,000 fewer self-employed workers in 1976 than in 1974. But self-employment responded strongly to the post-recession economic surge. In this respect, self-employed workers appear to be reacting like their wage and salary counterparts, rather than continuing their past counter-cyclical employment trends.[2]

Demographic features

Age. While the demographic characteristics of the self-employed differ from other workers, these differences have grown less sharp in recent years. For instance, the median age of the self-employed has typically been greater than that of wage and salary workers. Young workers are less likely to have acquired the capital and managerial skills needed to start a business; and many older workers who have withdrawn from wage and salary employment may wish to continue working via self-employment. But in recent years, the average age of the self-employed has dropped. The proportion of self-employed who are 16 to 44 years old rose by 10 percentage points, while those over age 45 decreased by the same amount. In part, this change is because of the nature of the population; with entry of the baby-boom generation, the median age of the labor force has fallen. But as can be seen in the following tabulation, the downward shift in age distribution (in percent) has been more dramatic for the self-employed:

	Self-employed			*Wage and salary*		
Age	*1972*	*1979*	*Change*	*1972*	*1979*	*Change*
16–24 . .	5.4	6.6	+1.2	23.1	24.1	+1.0
25–44 . .	35.7	44.3	+8.6	41.8	45.9	+4.1
45 and over	58.8	49.0	−9.8	35.1	30.0	−5.1

From 1972 to 1979, a comparatively large number of workers 25 to 44 years old entered self-employment.

Table 1. Employment by class of worker, 1948–79

1969	7,148	1,895	5,253	68,527	1,179	69,706	1,048	531	517
1970	7,027	1,810	5,217	69,446	1,153	70,599	1,001	499	502
1971	7,057	1,748	5,309	69,902	1,161	71,063	1,000	479	521
1972	7,121	1,789	5,332	72,381	1,216	73,597	984	467	517
1973	7,202	1,776	5,426	74,995	1,254	76,249	959	423	536
1974	7,386	1,752	5,634	76,325	1,349	77,674	876	391	485
1975	7,341	1,715	5,626	75,298	1,280	76,578	864	386	478
1976	7,326	1,637	5,689	78,041	1,318	79,359	800	342	458
1977	7,575	1,570	6,005	80,804	1,330	82,134	835	343	492
1978	7,912	1,607	6,305	84,253	1,418	85,671	788	316	472
1979	8,233	1,580	6,652	86,540	1,413	87,953	759	304	455

While many factors may have contributed to this development, apparently during the last decade younger workers placed a higher premium on being able to work for themselves than did prior generations.

Sex. Besides being disproportionately older, the self-employed have also been overrepresented by men. In 1979, 75 percent of self-employed workers were men, compared with less than 60 percent of wage and salary workers. Nevertheless, the number of self-employed women has been growing at a faster pace than either self-employed men or wage and salary women. Since 1972, female self-employment has increased by 43 percent or five times faster than male self-employment, and considerably faster than the 31 percent increase in the number of women employed as wage and salary workers. Thus, the female share of self-employment grew from about one-fifth in 1972 to one-quarter in 1979.

Race. Minorities have also been less likely to be self-employed, but, unlike younger persons and women, the proportion of self-employed who are members of minorities has not increased. Although the number of black self-employed has grown since 1972 by nearly 60,000 to 450,000, their proportion of all self-employed workers has remained constant at about 5.5 percent.[3] The number of self-employed blacks grew by only 14 percent from 1972 to 1979, just half the rate of increase incurred among black wage and salary workers.

Not only have blacks continued to be underrepresented among the self-employed, but those who have managed to start their own enterprises are most likely to be in service and blue-collar occupations, while white self-employed workers are more likely to be in the relatively high paying white-collar occupations. The following tabulation shows the occupational distribution (in percent) for self-employed workers in 1979, by race:

	Whites	*Blacks*
White-collar	48.7	40.7
Blue-collar	24.9	29.6
Service	8.7	21.2
Farm	17.6	8.4

Nonagricultural industry trends

From 1949 to 1972, the percent of workers in nonagricultural industries who were self-employed fell from 12.3 to 6.8. But since 1972, the trend reversed and in 1979 the proportion was 7.1 percent. During the entire 30-year period, however, the self-employed sector of agricultural employment has never stopped falling; it had been more than 60 percent in 1948 and was less than half in 1979.

Table 2. Self-employed and wage and salary workers, by occupation and industry, 1972–79, Annual averages

[In percent]

Characteristics	Self-employed		Wage and salary workers	
	1972	1979	1972	1979
Total employed	100.0	100.0	100.0	100.0
Occupation				
White-collar	46.6	48.3	48.1	51.2
Professional and technical workers	13.6	14.3	14.2	15.8
Managers and administrators, except farm	23.6	21.3	8.6	9.9
Clerical workers	7.8	9.9	6.4	6.0
Sales workers	1.6	2.8	18.9	19.5
Blue-collar	20.7	25.2	36.7	34.0
Craft and kindred workers	13.2	16.4	13.4	13.8
Operatives, except transport	2.6	3.0	13.8	12.1
Transport equipment operatives	2.6	3.1	4.1	3.8
Nonfarm workers	2.3	2.7	5.5	5.3
Service workers	9.1	9.3	13.9	13.7
Farm workers	23.4	17.2	1.3	1.2
Industry				
Goods-producing	18.7	22.3	34.1	32.0
Mining	0.2	0.3	0.8	1.0
Construction	13.9	17.0	6.2	5.9
Manufacturing	4.5	5.0	27.1	25.2
Service-producing	81.3	77.7	65.9	68.0
Transportation and public utilities	3.8	4.1	7.3	7.1
Trade	31.5	27.3	20.0	20.4
Wholesale	4.0	4.1	3.9	4.0
Retail	27.5	23.2	16.1	16.4
Finance, insurance, and real estate	4.9	6.6	5.6	6.1
Miscellaneous services	41.2	39.8	29.0	28.5
Public administration	0	0	6.1	5.8

Traditionally, the self-employed in the nonagricultural sector have been concentrated in the service-producing industries. The creation of a business in goods-producing industries—mining, construction, or manufacturing—usually requires large amounts of capital. But between 1972 and 1979, the percentage of the self-employed in this sector grew faster, from 18.7 to 22.3. (See table 2.) The construction industry led the increase, as self-employment accounted for more than one-third of the total employment gain in this industry between 1972 and 1979. In manufacturing, although the numbers grew substantially, self-employment continued to be relatively uncommon; only 1 of 20 self-employed workers was in manufacturing, compared with 1 of 4 wage and salary workers. The service-producing industries also witnessed substantial increases in the numbers of self-employed, as finance, insurance, and real estate, and miscellaneous services registered the strongest gains. But the growth rate in the service-producing sector was less than half that of the goods-producing sector mainly because of the slow growth in the number of retailers.

The relatively slow growth of self-employment in the service sector is in sharp contrast to the situation in the economy as a whole, because among wage and salary workers the service-producing sector has grown twice as fast as the goods-producing sector. But, interestingly, these differential growth patterns have combined to bring the industry employment patterns of self-employed workers closer to the patterns of all employed workers.

Occupational trends

Clearly some occupations lend themselves more easily to self-employment than others. For a small number of jobs, self-employment accounted (in 1979) for more than half of all workers. These categories included chiropractors, dentists, optometrists, podiatrists, authors, auctioneers, hucksters and peddlers, paperhangers, piano and organ tuners, shoe repairers, fishers, farmers, midwives, barbers, boarding and lodging housekeepers, and bootblacks.

During the period studied, the major development in occupational employment of the self-employed was the decrease in farm occupations. In 1972, 1 of 4 self-employed persons worked at a farm-related job; in 1979, 1 of 5. Partly as a result, the proportions of self-employed in white-collar, blue-collar, and service jobs all increased. Related to the more dramatic increase in the goods-producing industries was the sizable increase in blue-collar self-employment. The increase in the actual numbers of self-employed in the white-collar sector was of comparable size, but the percentage increase was less than half that of the blue-collar sector. The growth in the service occupations was even less marked. In the blue-collar occupations, craftworkers represented two-thirds of the increase. In particular, carpenters and other construction workers posted self-employment gains of about 120,000 and 130,000, respectively. The sales occupations led the increases in white-collar jobs, with a large jump in the number of self-employed persons in real estate sales and hucksters and peddlers. The growth in real estate and construction reflected the continued strength of the residential housing market, as the baby-boom generation added to the demand for homes. Self-employment has traditionally played an important role in residential construction.[4]

In general, these shifts in industry and occupational employment have caused self-employed workers to more closely parallel the patterns of their wage and salary counterparts. This tendency was especially true for self-employed men, as their employment shifts were much more dramatic than those of self-employed women in both industry and occupational categories. Though their numbers increased sharply, self-employed women continued to be concentrated in the trade and service industries and white-collar and service occupations.

Hours and earnings

Hours. Another distinguishing characteristic of self-employed workers was the many hours which they typically put into a workweek, but this dropped dramatically in recent years. In 1965, the average workweek for a self-employed worker in a nonagricultural industry was 46.8 hours; by 1979, that figure had fallen 4.9 hours to 41.9. Over the same period, the workweek of a nonagricultural wage and salary employee fell by only 1.1 hours to 38.4. This average weekly hours gap narrowed faster since 1972, as the self-employed workweek fell 5.2 percent, while the wage and salary workweek decreased by only 0.8 percent. Following are hours worked per week by self-employed and wage and salary nonagricultural workers:

	1965	*1972*	*1979*
Self-employed	46.8	44.2	41.9
Wage and salary	39.5	38.7	38.4

In part, this reduced workweek for the self-employed may reflect the influx of women and younger workers, both working relatively fewer hours as a general rule.

Earnings. But as their workweek has drawn nearer to that of wage and salary employees, the earnings of the self-employed continued to lose ground in comparison with the earnings of other workers. For example, between 1972 and 1978, the median annual earnings of both male self-employed workers and private wage and salary workers rose by about 50 percent to $10,240 and $12,016, respectively. Self-employed women on the other hand, actually lost ground as their earnings grew at a rate less than half that of other women employed in the private sector; in 1978, they earned $1,878 compared with $5,047 for their wage and salary counterparts. Meanwhile, mean earnings for self-employed men stayed well above that for wage and salary men, indicating that self-employed earnings are substantially skewed at the upper end of the earnings distribution. Apparently a number of self-employed really "strike it rich," while the majority continue to earn less than the average wage and salary worker.

Reflecting the differential impact of the recession, the earnings gap between self-employed and wage and salary workers grew during 1974–75. The self-employed do not experience the high unemployment rates of wage and salary workers, but their earnings are tied more closely to the success of their business. Rather than give up their businesses and join the ranks of the unemployed, the self-employed are more likely to continue working during a recession but take home less income.[5]

In general, self-employed men and women have more income flexibility than wage and salary workers. By adjusting their inventories, for example, they can use their business as a sort of personal savings account, by selling off or building up stock. Also, earnings of the self-employed tend to be understated because they exclude: the income implicit to the farmer who feeds his family with his own crops, the store owner who consumes his own stock, the businessman who saves money and time by working at home or using the business car for personal travel, and other nonmonetary income.

Incorporated businesses

Because of a change in the Current Population Survey in 1967, it became possible to identify those workers who had reported themselves as self-employed but had incorporated their businesses. These individuals were reclassified as wage and salary workers because a corporation pays all of its employees a salary, including the owner. The resultant number of self-employed persons was down by 850,000 in January 1967. Since then, the "incorporated self-employed" have been officially tallied with the wage and salary workers; for the purpose of this article, however, separate counts for March 1976 and 1979 were made and analyzed. (Another group which cannot be separated and studied are those incorporated self-employed who report themselves initially as wage and salary employees. There is no way to determine how large this group might be or to know whether it has grown larger or smaller over time.)

From March 1976 to 1979, the number of persons who classified themselves as self-employed but who were incorporated rose from 1.5 million to 2.1 million, an increase of around 40 percent. This jump was about four times the comparable increase for the remaining wage and salary workers or the officially self-employed workers.

The move toward incorporation is a function of many complex factors. A worker will usually incorporate his business for traditional benefits of the corporate structure, including limited liability, tax considerations, and the increased opportunity to raise capital through the sale of stocks and bonds.[6] But regardless of the underlying reasons, the overall increase in self-employment has been even greater than indicated by the basic statistics. And, for the purposes of labor force analysis, these workers are akin to the self-employed.

Demography. Even more so than most self-employed workers, the owners of incorporated businesses are likely to be older than the average worker. As the following tabulation shows, in March 1979, more than half of the incorporated self-employed were 45 years or older, compared with less than a third of all workers:

	16–24 years	*25–44 years*	*45 years or older*
Incorporated self-employed	2.0	44.9	53.2
All workers	21.9	45.8	32.2

These individuals are also more likely to be men: whereas 75 percent of the officially self-employed were men in March 1979, 84 percent of the incorporated self-employed were men. This figure is down from 90 percent in March 1976 but, nevertheless, indicates the degree to which men dominate the ranks of the incorporated self-employed. Therefore, in the areas of age and sex, the incorporated self-employed exhibit tendencies which differ from overall worker norms in the same way that other self-employed workers do—only more so.

Industrial and occupational employment. With respect to type of industry, these workers fall somewhere between their unincorporated counterparts and private wage and salary workers. Their employment distribution for March 1979 shows that they are more likely to be in the goods-producing industries than other self-employed workers. A low percentage in the miscellaneous services sector more than offsets a high percentage in the wholesale trade sector, and reduces the proportion in service-producing industries. Therefore, their employment distribution comes much closer to mirroring wage and salary patterns than does the distribution of all other self-employed workers.

But with regard to occupational employment, these incorporated entrepreneurs resemble no other class of worker. In March 1979, more than 80 percent were white-collar workers, compared with 50 percent of the other self-employed and 45 percent of private wage and salary employees. More than 50 percent were managers and administrators by occupation, which accounted for the sizable differentials between them and other workers. Given the nature of the corporation, this high percentage of managers and administrators is expected. By the time a single business is large enough to benefit from incorporation, the proprietors are usually devoting a great deal of their attention to managing it. For instance, these individuals might be spending most of their time running a construction firm rather than doing carpentry work, or managing a drugstore rather than performing pharmaceutical tasks. Although they account for only 2.3 percent of all workers, they represent almost 12 percent of all private managers and administrators; that proportion rises to 30 percent when the unincorporated self-employed managers and administrators are included.

Earnings. With regard to earnings, the incorporated self-employed are unique. Their median earnings of $20,187 for March 1979 was more than double that for either private wage and salary or other self-employed workers. This is linked to the corporate tax shelter—it is advantageous only for self-employed persons in the highest income brackets to incorporate and thus their total income—salary and dividends—was much higher.[7] These earnings figures also help to explain the occupational mix of this group of workers, which is skewed towards the typically high earning, white-collar occupations such as doctors, lawyers, and managers. In turn, the earnings and occupational characteristics help explain the age and sex profile of these jobholders.

As noted, incorporation is a largely technical distinction; instead of working for themselves, these people work for their corporation. Therefore, their numbers, and especially their recent growth, must be considered when discussing the status of the self-employed. Their high earnings moderate the earnings gap between wage and salary earners and self-employed workers. This more inclusive view of self-employment might help to explain its recent strength.

Conclusion

Overall, the self-employed exhibited strong labor market growth during 1972–79. Not only have their numbers experienced sustained growth for the first time since World War II, but they are developing cyclical, industrial, and occupational patterns, as well as sex, age, and workweek characteristics that are much more similar to the rest of the work force. Only their racial and earnings distribution continue to diverge from those of wage and salary workers. But it is interesting to note that the two major developments in self-employment have apparently occurred simultaneously; as the appeal of self-employment has intensified, the differences between self-employed workers and the remainder of jobholders have waned. □

——*FOOTNOTES*——

[1] The data in this article were derived from the Current Population Survey. This is a monthly survey of 65,000 households conducted by the Bureau of the Census for the Bureau of Labor Statistics.

[2] The tendency for the self-employed sector to react countercyclically was discussed by John E. Bregger, "Self-Employment in the United States, 1948–62," *Monthly Labor Review*, January 1963, pp. 37–43, and his observation was updated by Robert Ray, "A report on self-employed Americans in 1973," *Monthly Labor Review*, January 1975. Data from the most recent recession support the theory that self-employment is now reacting cyclically. From a high of 8,550,000 in February 1980, their number fell to 8,260,000 by May.

[3] The term "black" refers to all persons in the survey other than white. In addition to blacks, the group includes American Indians, Alaskan Natives, Asians, and Pacific Islanders.

[4] Joseph D. Phillips, *The Self-employed in the United States* (Urbana, Illinois, University of Illinois, 1962), p. 29.

[5] The unemployment rate for wage and salary workers was 8.5 percent in 1975 compared to only 2.0 percent for self-employed workers. For a discussion of this type of "concealed unemployment" see Phillips, *Self-employed*, p. 53–6, or Srully Blotnick "Maintaining Appearances," *Forbes*, May 26, 1980, pp. 152–53.

[6] Another advantage of the corporation is the increased allowance for pension fund tax shelters. Steven S. Anreder felt that "of the many desirable features of incorporation, the pension advantage is the most outstanding." For a general discussion of this topic, see Anreder, "Retirement Dollars for the Self-employed," (New York, The Dun & Bradstreet Business Library, 1972). The Keogh plan, which provides retirement deductions for the self-employed, was revised in 1974 to allow a yearly write-off of $7,500 or 15 percent of earned yearly income, whichever is less. However, the corporation can establish a more comprehensive pension program.

[7] For a comprehensive study of the often complicated tax status of self-employed workers, see *Tax Treatment of Employees and Self-employed persons by the Internal Revenue Service—Problems and Solutions: Report to the Joint Committee on Taxation, Congress of the United States by the Comptroller General of the United States* (Washington, U.S. General Accounting Office, 1977).

U.S. labor turnover: analysis of a new measure

New method of determining labor turnover, which includes fiirms from all sectors, shows much more hiring activity than is shown by the Bureau of Labor Statistics survey, which is derived mainly from manufacturing; however, the two series' separation rates are not as far apart

MALCOLM S. COHEN AND ARTHUR R. SCHWARTZ

Labor market analysts, employment counselors, and employment security administrators have long been handicapped by the lack of broad-based labor turnover data. Until recently, the only labor turnover data available have been those generated by the Bureau of Labor Statistics' Labor Turnover Survey, which provides monthly estimates of labor turnover for manufacturing and a few selected nonmanufacturing industries. Although useful as an economic indicator, the data show turnover primarily in only one sector of the economy—manufacturing.

Now, a new methodology obtains data from manufacturing and nonmanufacturing firms of all sizes without placing additional reporting requirements upon them.[1] This method generates, for the first time, information about the volume of accessions, new hires, and separations in both the manufacturing and nonmanufacturing sectors of the economy.

This article presents quarterly new-hire and separation rates derived from the new methodology. Surprisingly, these data suggest that the new-hire rate for nonagricultural firms in the second quarter of 1974 was 25 percent. On an annual basis, this would mean that the average firm hired almost as many workers as its average employment that year. The estimates then are contrasted with BLS and other turnover data, and no major unexplained discrepancies were found. However, it was not possible to obtain accurate estimates of nonsampling errors. For this reason, the estimates contained in this article should be viewed as preliminary.

How data are obtained

This study uses employee earnings information submitted by employers to the Social Security Administration. Until 1978, employers were required to submit quarterly earnings information for each individual employee to the Social Security Administration.[2] To derive turnover data, a special tabulation of a 1-percent sample of these records was prepared in cooperation with the research and data processing divisions of the New York State Employment Service. At the time of preparation, the most current data available were for 1974. From this tabulation, new-hire rates were derived for all 50 States and the District of Columbia for the second quarter of 1974. Separation rates were computed for the first quarter of 1974.

Because there is an income ceiling ($13,200 in 1974) for social security reporting, some employees may "dis-

appear" from the payroll when in fact they are still working. Increasingly, in the latter quarters of the year, these workers may be inadvertently counted as separations and may be identified mistakenly as accessions in the following first quarter. Therefore, accession data were calculated for the second quarter and separation data, for the first quarter.

Turnover measures were computed by comparing the social security numbers of employees working for a given employer in a given quarter with the social security numbers reported by the same employer in prior quarters. Because these new measures cannot assign turnover to a particular month or distinguish as many types of turnover transactions as the BLS survey, their definitions differ from those used by BLS.[3] Following are terms used in deriving turnover rates for this article, along with those used by the BLS:[4]

Social Security data

Accession	—	The employee worked for an employer in a given quarter but did not work for that employer in the previous quarter.
Separation	—	The employee worked for an employer in a given quarter but did not work for that employer in the previous quarter.
New hires	—	The employee worked for an employer in a given quarter but did not work for that employer in any of the previous five quarters.

BLS data

Accession	—	The total number of additions to the employment roll in a particular month.
Separation	—	Terminations of employees in the calender month.
New hires	—	An addition to the employment roll resulting from (1) a person who has never worked in the establishment, or (2) a former employee who was not recalled by the employer.

An arbitrary cutoff of five quarters is used to separate a new hire from a recall. The longer the period used to define the new hire, the more costly the process of computing the series and the shorter the time series available. For example, if unemployment insurance wage data are available for 5 years and if a new hire is defined as "not working for that employer in any of the 20 previous quarters," no new hires could be derived until data from the 21st quarter became available. Then, only one quarter of new-hire data could be obtained. Using too few quarters will result in misclassification as new hires, persons who had worked for the same employer previously. Going back 5 quarters offers the advantage of eliminating as new hires seasonal employees who work for the same employer one season a year and persons who worked at all in the previous year.[5]

The employer account numbers in the data sources permit association of the turnover measures with employer characteristics such as geographic location, industry, and size-of-firm class. New-hire data may also be analyzed by number of quarters of resulting employment and quarterly earnings levels.

Uses of the data. Some of the uses contemplated for these data are: (1) new hire data may be a potential factor in allocation of Federal funds to the U.S. Employment Service; (2) the data can be used by job developers to determine the firms with the greatest potential for applicant hires. Seasonal hiring patterns and trends projected from these data can assist Employment Service and Comprehensive Employment and Training Act prime sponsor planning efforts; (3) the data may assist in evaluation of social programs. The Employment Service, for example, has been criticized for placing most of its applicants in jobs lasting less than 180 days. However, preliminary data from the Employment Service suggest that 60 to 70 percent of all new hires' job tenure is of relatively short duration, that is, less than 9 months;[6] (4) the data can provide information for the internal management of U.S. Department of Labor employment programs. It may assist in determining the location of Employment Service local offices, setting placement goals, measuring performance, and validating placement information; and (5) a number of hypotheses pertaining to theories such as segmentation of labor markets, the relationship between low wage levels and turnover, and turnover patterns over the business cycle can be tested with these data.

Turnover rates, by region and industry

Table 1 shows new-hire rates for the second quarter of 1974 by region for all major industry divisions, except agriculture.[7] The quarterly new-hire rate for the entire nonagricultural private sector (25.0 percent) is much higher than that for manufacturing (16.2 percent). Across the Nation, the highest nonagricultural quarterly new-hire rates were in construction, a highly volatile sector subject to large seasonal and cyclical changes in employment and, therefore, to excessive labor turnover. Retail trade and services also had high turnover rates, which may be attributed to the preponderance of small firms and to the relative large numbers of easy-entry, low-skill jobs in these industries.[8] The transportation and public utilities sector consistently showed the lowest new-hire rates.

The South, the Southwest, the Mountain States, and the Northwest (regions IV, VI, VIII and X) had the highest new-hire rates in the second quarter of 1974. The Midwest and New England (regions V and I), hardest hit by the Arab oil embargo and recession, had

the lowest rates. The rapid growth of the population in the "sun belt" States (which include region VIII and IX) may also have contributed to the differences between their new-hire rates and those of the Midwest and East. Even manufacturing's new-hire rates were higher in the Western States because of the lighter nature of their industry and the development of Western energy reserves, which led to an expansion of the industry and, hence, more new hires.

Table 2 presents analogous first-quarter 1974 separation rates. Manufacturing rates were again below those for the entire nonagricultural private sector, but by a small margin. Construction, retail trade, and services continued to have the highest rates; transportation and public utilities, the lowest. Regional differences were less pronounced than for new hires. The South, Southwest and West (regions IV, VI and IX) had higher rates than the Midwest and New England (regions V and I).

Tables 3 and 4 present the industries with the highest and lowest new-hire and separation rates nationally. Many of the industries with very high new-hire rates also have high separation rates. The same pattern is repeated among industries with particularly low new-hire rates. Electric, gas, and sanitary services, for example, had the lowest separation rate. The low turnover industries tend to be in the manufacturing, transportation, and public utility sectors, while the high turnover industies are in services, retail trade, and construction.

Standard errors low

The reliability of these results can be assessed in two ways, sampling errors and nonsampling errors. Sampling errors are illustrated by computation of standard errors. Nonsampling errors are assessed by comparison of the results with other data.

The standard errors of the data in tables 1 and 2 are quite small. Among the regional totals, region VIII has the highest standard error, 0.39, which gives a coeffi-

[2] Employment represented less than 50,000.

Source: Institute of Labor and Industrial Relations, University of Michigan, from 1-percent social security tabulation.

cient of variation (standard error adjusted for a rate per 100 employees divided by the turnover rate) of 1.1 percent. No major division in any region has a standard error greater than 5.0 and most are below 1.0. The largest coefficients of variation are in mining (the only regional cells with employment below 100,000), with only region V mining having a coefficient greater than 10 percent. (The standard errors for the State totals are also relatively low.)

The standard errors for the data in tables 3 and 4 are again generally low. For eating and drinking places, the standard error is 0.3, so one can be 95 percent certain the actual new-hire rate falls between 58.0 and 59.2. The coefficient of variation is 0.5 percent.

Three comparisons are made to assess nonsampling errors: BLS turnover data, wage records data from specific States, and job tenure data from the Current Population Survey. Because the BLS turnover data is the most widely used, a comparison of BLS and social security new-hire rates helped in the analysis of the new series. This study's new-hire rates for manufacturing are approximately 40 percent higher than BLS' published estimates for the second quarter of 1974. A number of factors contribute to this differential.

The first factor is the difference in the denominators of the turnover rates. This study's employment measure, a beginning-of-quarter count of social security wage items minus accessions, is a stock. The BLS survey denominator, payroll period employment, is a stock plus partial flow. Thus, the nature of this study's denominator leads to a small overstatement of rates relative to those of the BLS survey.

The second source of difference is the tendency of this hew methodology to register errors in input, such as keypunch errors, transposition or reporting errors, and recording of employers switching firm identification numbers as new hires.

The greatest source of the variance between the two series is the nature of the BLS survey sample. A voluntary sample directed at large establishments, it fails to provide an adequate reflection of small firms, whose turnover rates are considerably higher. BLS estimates that its sample contains only 1.8 percent of total employment in firms of nine employees or fewer, 7.5 percent of total employment in firms with fewer than 19 employees, but 72.5 percent of the total employment of firms with more than 1,000 employees.

Firm size is important as a determinant of the turnover rate. For example, for all firms in manufacturing, the social security new-hire rate was 5.4 percent a month (or 16.2 percent a quarter) in the second quarter of 1974. The rate for firms with more than 500 employees was 3.7 percent; for firms with more than 1,000 employees, 2.9 percent. Therefore, the BLS turnover rate of 3.8 percent appears to best reflect the employment changes of firms with more than 500 employees.

Because there is less variability in separation rates by size of firm, the social security and BLS separation rates for 1974 were much closer together, 5.4 percent and 4.4 percent, respectively. Thus, the structure of the BLS sample results in less downward bias in its separation data.

Estimates of new-hire rates were made from unemployment insurance wage records for three States in the second quarter of 1974. Following are these rates, along with those estimated from social security records:

	Unemployment insurance	*Social security*
California	31.0	27.6
Idaho	38.5	33.3
Pennsylvania	20.8	17.4

The rates estimated from unemployment insurance are slightly higher because they are based on four quarters of data rather than five. (In California, there were only 1 percent more new hires recorded when four quarters of data were used.[9]) The major reason for differences can be attributed to coverage: the social security administrative records include only persons earning

Table 3. New-hire rates in selected industries with high and low turnover rates, second quarter 1974

Industry	New-hire rate (per 100 employees)	Employment (in thousands)
Low turnover

at least $50 in a given quarter; the unemployment insurance wage records include all wage earners.

These comparisons are for transaction-based turnover systems. Another way to view turnover is to examine the median job tenure of the working population, or a person-based system. For example, in January 1978, the median job tenure was 3.6 years;[10] 28.2 percent of the working population had been at their current job 1 year or less. However, it is possible for an individual to account for many new hires. For example, if a person has several new jobs in a year, that person would be counted once as having his or her current job less than a year, in a person-based system, but each new job would be counted as a new hire in a transaction-based system.

Both systems can be useful in analyzing turnover. The transaction-based system measures the number of jobs that are new hires, while the person-based system measures an individual's time on a given job as well as the number of persons hired in a period.

THESE NEW MEASURES of labor turnover show more hiring activity than do BLS' manufacturing estimates. They also indicate that there is dramatic variation in new-hire rates across industries. Industries such as communications and public ultilities have new-hire rates of less than 8 percent per quarter, while industries such as building construction and eating and drinking places have rates exceeding 57 percent per quarter. As more data are obtained from wage records and time series estimates can be made, additional analysis of labor turnover patterns will be possible. ☐

FOOTNOTES

[1] This methodology has been developed under the auspices of the Employment Service Potential project of the United States Employment Service and cooperating State Employment Security Agencies.

[2] Beginning in 1978, employers have submitted annual reports.

[3] The BLS survey can register in-State, interestablishment transfers for multi-establishment firms, rehire and layoff of workers whose layoffs are of very short duration (less than one quarter), and the involuntary and voluntary components of separations—all turnover transactions which these new measures cannot distinguish.

[4] For a complete listing of the measures which may be generated with this new methodology, see Malcolm S. Cohen, *ESP: A New Source of Labor Market Information* (Ann Arbor, Institute of Labor and Industrial Relations, University of Michigan, Wayne State University, 1978); and Glenn Siebert, *Employment Service Potential: Indicators of Labor Market Activity* (Sacramento, Calif., Employment Development Department, 1977).

[5] The California Employment Development tests of its data indicated that the percentage of accessions classified as recalls increases only marginally if seven quarters are used to define a recall rather than four. See Siebert, *Employment Service*, pp. 48–49.

[6] See Cohen, *ESP*, p. 20, and Philip Hardiman and Marged Sugarman, *Employment Service Potential: The Dimensions of Labor Turnover* (Sacramento, Calif., Employment Development Department, 1979), p. 5.

[7] Agriculture is omitted because of problems in social security coverage of this sector.

[8] Firm size, along with industry and time period, has been suggested as a determinant of labor turnover. California's Employment Development tests demonstrated an inverse correlation between firm size and turnover rates, with small firms having higher rates than larger firms when industry is held constant. See Siebert, *Employment Service*, pp. 56–57.

The retirement decision: a question of opportunity?

Age discrimination laws now protect workers through age 70, but most choose to retire sooner; lack of acceptable job options keeps many out of the labor force who desire work

PHILIP L. RONES

The "graying of America" could have a more profound impact on our lives than any demographic phenomenon since the end of the great waves of immigration. Its influence will be felt in areas as diverse as politics and consumerism, health care and education, family structure and taxation. Researchers, policymakers, and planners interested in these and other fields have begun to study the potential impact of the aging population, to avoid a 21st century crisis when the "baby boom" generation reaches retirement age. The controversies concerning two key subjects, the future solvency of social security and pension funds, and the recent changes in Federal laws affecting mandatory retirement, have pushed labor force issues on aging into the forefront of debate.

Retirement trends are not easily identified as either positive or negative. Among some observers there is concern that older people in the job market frustrate career aspirations of younger workers or are too costly for employers. At the same time, however, there is concern about the long-term effects of too few older workers—that the number of retirees will drain the economy and place unfair burdens on the young. Because of the critical importance of the decision to retire, many organizations, both private and public, have begun to monitor closely the labor force characteristics of persons near, at, or beyond normal retirement age.

Three issues

This report attempts to clarify several retirement developments, focusing on three issues:

- The extent to which labor force participation rates, such as those available from the Current Population Survey (CPS), can be used to assess the impact of changes affecting the decision to retire;
- The anticipated impact on employment among the elderly, of the 1978 Amendments to the Age Discrimination in Employment Act (ADEA), which raised the allowable age for mandatory retirement, in most cases, from 65 to 70;
- The potential labor supply among current retirees, or to what extent does this group want to work?

From 1950 through the mid-1970's, labor force activity among older persons in the United States declined markedly. (See table 1.) Two recent events have led many observers to anticipate a reversal of this long-term trend: the passage of the 1978 ADEA Amendments, prohibiting forced retirement prior to age 70,[1] and the unusually high rate of inflation with its negative effect on the anticipated value of retirement income.

However, it is difficult to isolate the impact of these or other factors, because changes in labor force participation rates are the end result of complex interaction by various forces. Sometimes a single force dominates, leading to a clear trend. For example, the rapid growth of retirement income from private and public pensions and from disability benefits contributed to dramatic de-

clines in the labor force activity of older men (age 65 and older) during the past 30 years.

For older women, during the same period, labor force participation rates moved little, remaining at about the same levels in the late 1970's as 30 years earlier. But it would be inaccurate to conclude that there were no powerful influences on the retirement decision of older women during this period. Rather, two strong forces were opposing each other: on one side, improving retirement income, by itself, would have lowered participation rates of older women; on the other, the rapid rise in participation among women in general, the dominant labor force trend since World War II, served to counter this income effect.

The labor force participation rate for older men has not changed markedly during 1976–79. Again, the lack of a clear trend belies the complexity of the forces influencing the retirement decision. Social security benefits have, by law, been tied to the Consumer Price Index and private pension coverage has provided income supplements to a growing number of retirees.[2] This, of course, allows more workers to retire. However, countering these income improvements have been the recent high rates of inflation and threats of recession (and, subsequently, its realization) which, undoubtedly led some older workers to postpone retirement. Although this description is an oversimplification, it does demonstrate that the impact of a single factor on the retirement decision can easily be hidden by countering factors.

ADEA—limited impact

Despite the intense debate for and against its passage, it is likely that the 1978 Amendments to the Age Discrimination in Employment Act will have little short-term impact on the retirement decision. This is because, even prior to its enactment, proportionately few workers were actually forced out of their jobs by mandatory retirement provisions. Many people retire before reaching mandatory retirement age, which typically has been age 65. The youngest retirees, those who leave the labor force before age 62, frequently do so for health reasons.[3] After age 62, the earliest age of social security retirement eligibility, the decision becomes more economic; the marked improvements in public and private retirement eligibility and benefits has permitted many workers to retire prior to age 65.

Even among persons who leave the work force at age 65, mandatory retirement is not always evidence of forced retirement. Because of the strong correlation between mandatory retirement provisions and private pension coverage, most employees reaching age 65 under mandatory retirement policies can draw full pensions and full social security as well. Thus, many workers would have retired willingly at age 65, regardless of company requirements.

Table 1. Labor force participation rates of older workers by sex, annual averages, selected years, 1950–79

Years	Men		Women	
	60 to 64 years	65 years and over	60 to 64 years	65 years and over
1950	...	45.8	...	9.7
1955	82.5	39.6	29.0	10.6
1960	81.1	33.1	31.4	10.8
1965	78.0	27.9	34.0	10.0
1970	75.0	26.8	36.1	9.7
1975	65.7	21.7	33.3	8.3
1976	63.7	20.3	33.1	8.2
1977	62.9	20.1	32.9	8.1
1978	62.0	20.5	33.1	8.4
1979	61.8	20.0	33.9	8.3

Studies using several data sources indicate that prior to the ADEA Amendments, only 5 to 10 percent of retired workers were forced to retire.[4] The sources are the 1968 and 1969 Survey of Newly Entitled Beneficiaries (SNEB, from the Social Security Administration), The Retirement History Study, the National Longitudinal Survey, and the 1974 Louis Harris Survey (conducted for the National Council on the Aging). One technique they used was to reduce the population age 65 and over, step-by-step. For example, using percentages of the total for men from the 1968 SNEB: start with those covered by mandatory retirement provisions, 54 percent; reduce to those who actually worked until mandatory retirement age, leaving 24 percent; reduce that to those who were unwilling to retire, leaving 14 percent; and reduce that to those who were able to work, leaving 10 percent; finally, reduce to those who did not find other jobs, leaving 7 percent.[5] The final figure is that of workers who were actually forced out of the labor force by mandatory retirement. This and similar estimates from the other surveys may overstate the recent effects of mandatory retirement; participation rates declined significantly since the time of the surveys. Thus, the true impact of the ADEA amendments would probably be felt by even fewer workers.

For some employees, the impact of the ADEA could actually be earlier labor force withdrawal. If a business thinks its interests are served by early retirement of its employees, how does it react to the law? One option would be to stiffen productivity requirements, leading to more firings. Before, if an employee's productivity had fallen at age 60, for example, because of declining physical skills or outdated job-related skills, the employer would only be faced with a few years of additional employment. The business might have been willing to retain the employee, and make adjustments to accomodate him. However, faced with a much longer period of potential employment, the firm might find the option of terminating the employee more attractive. Thus, ADEA might actually shorten the job tenure of some workers whose value to employers might be declining. Another option, one that might be used more frequently, would be to improve the economic incentives of retirement to induce voluntary labor force withdrawal. This process might include retirement bonuses or early retirement options, for example. It is possible that the ADEA amendments will expand the practice among some employers of inducing voluntary retirement with generous retirement packages.

In summary, the recent legislation, in the absence of other mitigating factors, would be expected to affect the retirement behavior of only a small proportion of older workers and retirees. However, with a continuation of high rates of inflation, the ADEA protection may be used increasingly by employees who are faced with deteriorating retirement income prospects.

Desire to work

Among the most baffling issues related to retirement is that of the potential labor supply among the elderly who are outside the labor force. To what extent do people who are beyond "normal" retirement age want to work? There are two radically divergent views:

First view. The decision to retire, at least for those in good health, is largely economic—a person who can afford to retire generally will. In this argument, for the current generation of retirees, work is seen primarily as bad rather than good. Justification for this assumption comes from an analysis of the education and work histories of present retirees. Workers age 65 and over who are out of the labor force have a median educational attainment of only 9 years, and only 15 percent have attended college.[6] As would be the case for any group with low levels of education, they have tended to work in jobs with comparatively little satisfaction and hence, little non-financial hold on them.[7] As the baby boom generation, which is better educated and in better jobs, reaches retirement age, individuals may be more likely to postpone retirement than today's older workers to whom continued employment at the same job, beyond the age of full pension, probably has little allure.

Evidence of this preference for retirement is available from the CPS.[8] Persons classified as not in the labor force (neither working nor seeking work) were asked whether they now want regular jobs either part or full time. If there were many involuntary retirees, a large "yes" response would be anticipated. However, only about 1 in 35 men (and an even smaller proportion of women) age 60 and over said they want work, only a third of whom cited job market factors as the reason for not seeking it.[9]

Second view. Many older retired persons want employment but are prevented from working by forced retirement, age discrimination, or inhibiting job structure (few part-time, part-year, or job modification opportunities). Those who want to work do so not only for economic reasons, but also for feelings of usefulness and satisfaction.

Supporters of this view cite several data sources, the most impressive being a 1979 survey conducted by Louis Harris and Associates for the consulting firm of Johnson and Higgins.[10] Nearly half of the retirees questioned said they would prefer to be working, and more than half would have preferred to keep working rather than retire.

Another possibility. A middle-ground explanation may evolve from these two vastly divergent views. Why do the 1979 Harris Survey results show that so many of the retired want to work? The best explanation may come from a question that was not asked. In the 1974 Louis Harris Survey, conducted for the National Council on Aging,[11] retirees age 65 and over were asked whether they would like to work; 31 percent said they would. But they were also asked "What's keeping you from working?" The responses showed that only 15 percent of the 31 percent, fewer than 5 percent of the retirees, cited the job market as their reason for not working. Most cited poor health, old age, or other interests. Thus, a far greater proportion of retirees indicated they wanted to work than could actually be considered able or available.

The 1979 Harris Survey did not ask the same "reason for not working" question. The nearly 20 percent difference in response to the "want to work" question between 1974 and 1979 has at least three possible explanations. First, the group of retirees was far younger in the later survey, having a median age of only 62 years. Although no median age is provided in the documentation to the 1974 study, the group of retirees was restricted to persons age 65 and older. One might expect the younger group, with a more recent labor force attachment, to be more likely to consider favorably the employment option. This may be particularly so if many of those in poor health indicated they want employment, as was clearly the case in the 1974 survey. The second explanation is that if the 1974 sample and survey were replicated exactly in 1979, inflation would probably have caused a higher degree of job interest in 1979. And third, as evidenced by the enactment of the ADEA and the 1975 Age Discrimination Act. The rights of older persons to equal access to jobs and to equal treatment in all Federal programs and activities, have been confirmed. Today's older workers may be less willing to "step aside" to provide younger persons a place in the labor force than were their predecessors.

Undoubtedly many more than 1 in 30 or 40 retirees (from the CPS results) would want to work under better job market conditions. Some people responding to the CPS that they do not want a job now may mean they are not interested in the types of jobs that are available to them. In the Harris survey, on the other hand, the "want a job" questions were asked in the context of a list of hypothetical work options probably not available to most respondents. When older workers no longer wish, or are unable to work full time, few options short of total retirement are available. Part-time "phased retirement" is rarely offered, and those jobs that are open to retirees tend to be of the low-skill, low-pay variety. As Harold Sheppard and Sarah Rix point out,[12] older people may choose retirement not because they literally want to retire completely, but because they do not wish to remain in the same dissatisfying jobs. The difficulties that they have in obtaining more satisfying kinds of employment may mean that total retirement is their best option.

It may be true that few workers have actually been forced to retire, particularly by mandatory retirement policies. However, institutional forces, including age discrimination and a lack of job opportunities which match the needs of the elderly, have probably contributed to the exit from the job market of many who otherwise would wish to remain. The many methods used to obtain labor market data from older people tend not to reveal the true causes of nonparticipation.

The U.S. Department of Labor, mandated by Congress to report the effects of the 1978 ADEA Amendments, has contracted to obtain additional longitudinal data from the Retirement History Study on the effects of mandatory retirement on older workers. The Department has also contracted a national survey of employees and employers in order to study the response of both groups to changes in the minimum mandatory retirement age. These and other research efforts, should dispel some of the confusion surrounding the retirement decision. ☐

Productivity gains in the drugstore industry, 1958–79

Spurred by the expansion of chains and large independents benefiting from economies of scale, the rate of growth in output per hour exceeded that of the private sector until 1973, but has lagged during the last 7 years

BRIAN L. FRIEDMAN

Output per hour of all persons in the drug and proprietary store industry[1] increased at an average annual rate of 4.6 percent from 1958 through 1979,[2] as compared with an average of 2.0 percent for the nonfarm business sector of the economy during the same period. This gain in productivity over the 22-year period reflects an average annual increase of 4.7 percent in output with virtually no average change in hours of all persons in the industry. For the most recent 7-year period, 1973–79, productivity increased at a slower annual rate—averaging 1.0 percent. (See table 1.)

The strong growth in output per hour of all persons has been influenced by a trend toward fewer and larger stores. Large chainstore organizations[3] and groups of stores known as cooperatives and voluntaries[4] have grown to dominate industry sales, while the number of unaffiliated, independently owned, smaller drugstores have declined significantly. Chains have increased the number of stores in high-volume shopping centers and have expanded the number and type of products offered. In contrast to independents, chains, cooperatives, and voluntaries could more easily take advantage of technological advances and use better management and marketing techniques.

In 1958, there were 56,232 drug and proprietary stores with employment of more than 405,000 persons. In 1979, this number fell to an estimated 46,000 stores employing more than 524,000 persons; sales in terms of constant dollars increased more than 140 percent from 1958–79. As the population grew, the average number of people served per store rose from 3,097 in 1958 to 4,785 in 1979.

Productivity rises

Output per hour of all persons engaged in the operation of drugstores grew more than 125 percent during 1958–79. While sales per store increased dramatically, employee-hours per store grew at a much lower rate, leading to the large productivity gains.

Although the average number of paid employees per store rose from 6.2 in 1958 to 10.7 in 1979, an increase of 73 percent, employee-hours per store rose only 44 percent because of increased use of part-time workers. These increases in employees and hours per store, how-

---

Brian L. Friedman is an economist in the Division of Industry Productivity Studies, Bureau of Labor Statistics. John Ferris, an economist in the same division, assisted in the development of the measure.

ever, are far outweighed by the rise in real sales per store, which nearly doubled.

Productivity growth can be divided into three distinct subperiods, 1958–65, 1965–73, and 1973–79. In the first period, productivity grew at a rate of 3.8 percent per year. This period coincides with the growth in the number of large, more efficient drugstores, as well as a decline in the number of small, marginal stores. Output grew 4.6 percent per year from 1958–65. Hours of all persons, however, only increased at the rate of 0.9 percent annually during the same period, resulting in moderate productivity gains.

Productivity increased more sharply in the second period, 1965–73, gaining at an average annual rate of 6.2 percent per year. The growth in number of large stores and decline of small, marginal stores accelerated during this time. This period was also marked by the widespread use of technological innovations which aid operations in pharmacy departments, streamline inventory procedures, and increase efficiency in warehousing operations. Output grew at a rate of 5.5 percent per year, while hours of all persons declined at a rate of 0.6 percent, resulting in large productivity gains.

. . . then slows

In the third period, 1973–79, productivity slowed to an average annual rate of only 1.0 percent mostly because of a general slackening in the economy, which was marked by a decline in the growth of spending (in terms of real dollars) in many retail industries. During this period, output growth slowed to a rate of 1.4 percent per year. In the recession year of 1975, both output and productivity declined. Output fell 0.1 percent, while hours of all persons had a relatively large increase of 3.1 percent, resulting in a 1975 productivity drop of 3.1 percent. The industry had productivity increases in 1976 and 1977, but productivity declined 2.7 percent in 1978. A increase of 0.8 percent was registered in 1979.

Table 1. Productivity and related indexes for the drugstore industry, 1958–79

[1967=100]

Year	Output per hour of all persons	Output per person	Output	Hours of all persons	All persons
1958	68.0	73.7	63.1	92.8	85.6
1959	70.8	76.9	67.5	95.4	87.8
1960	73.1	78.7	71.1	97.2	90.3
1961	75.7	81.3	73.3	96.8	90.2
1962	77.3	84.7	77.5	100.2	91.5
1963	81.0	87.3	79.9	98.7	91.5

1979	153.6	137.9	152.7	99.4	110.7
	Average annual rates of change (in percent)				
1958–79 . .	4.6	3.4	4.7	0.0	1.2
1973–79 . .	1.0	0.4	1.4	0.5	1.0

Developments in the prescription department may have added to the negative pressures on output and productivity during 1973–79. Restrictions on refills for controlled substances such as prescription pain relievers and tranquilizers became more stringent. Third-party payments for prescriptions grew strongly during this period; and medicaid and many private insurance plans required that long-term prescriptions be filled in larger orders. These influences led to a decline in the number of refill prescriptions.[5] The paperwork involved in third-party payments and recordkeeping for controlled substances also added to unit labor requirements in the prescription department.

Drugstore industry output was further slowed in the 1973–79 period by increased competition from other retail industries. Food stores and variety merchandise stores increased the number of prescription drug, over-the-counter-drug, and health and beauty aid departments in their stores, which took sales away from the drugstore industry.[6]

During 1973–79, the number of drugstores declined slightly. However, chains continued to build new, larger stores, while many small chainstores and small independents went out of business. These new stores accounted for above average growth in hours of all persons during this period which, coupled with a sluggish output growth, brought productivity levels down. Hours of all persons increased 2.6 percent in 1978 and 1.1 percent in 1979, reaching its highest level since 1967.

Employment increases moderately

The industry's employment grew at an average annual rate of 1.2 percent during 1958–79. All-person-hours increased at an average annual rate of 0.9 percent during 1958–66, but actually declined slightly during 1966–79. This occurred because of a generally shorter workweek, which stemmed from the use of more part-time workers. Overall, all-person-hours showed no growth in 1958–79. There was a sharp drop in the average weekly hours of nonsupervisory workers, declining from 37.7 in 1958 to 30.9 in 1979.

Nonsupervisory workers make up more than 80 percent of all persons working in the industry. They include cashiers, floor assistants, fountain workers, and stock workers. There has been a substantial increase in the number of part-time workers, usually unskilled workers of school age—who work during the evenings and weekends.

Proprietors and partners accounted for 4.9 percent of all persons working in drugstores in 1979. Their proportion of employment declined from more than 13 percent in 1958 because the majority of stores going out of business were privately owned, smaller stores. Most self-employed workers are pharmacists who average more than 50 hours of work per week in fulfilling both their professional and business duties.

As corporate stores grew in importance, managers accounted for a higher percentage of employment. Some proprietors and partners also hired managers, especially those owning more than one store. The number of supervisory workers almost tripled during 1958–79.

Industry structure changes

The 1958–79 period showed marked change in industry structure. The number of chainstores as a proportion of all drugstores remained fairly constant from 1930 to 1960.[7] In 1958, independents accounted for 78.5 percent of industry sales, and chainstores accounted for only 21.5 percent. During 1958–66, chains were opening from 700 to 1,000 new stores per year, primarily in shopping centers, and even more opened in the late 1960's and early 1970's.[8] By 1967, the independents' share of industry sales had declined to 66.9 percent. By 1977, the growing domination of chains was quite clear as they rang up more than 53 percent of all drug and proprietary store sales, while accounting for only 23 percent of all stores.

There is evidence that the increase in the number of larger stores, including large independents, has spurred productivity growth. In 1967, drugstores having sales of more than $500,000 sold $32,600 worth of goods and services per paid employee, compared with only $24,500 for stores doing less than $500,000.

Small independents frequently cannot compete on price and variety of merchandise because their low sales and small space limit volume discounts. Some independents are able to overcome price problems by joining or forming a wholesale group (voluntary or cooperative) which can obtain volume discounts for its members. Drugstores joining such organizations have access to marketing conditions and technology similar to chains.[9] In 1973, the unaffiliated independent drugstore had $175,000 in sales on the average, whereas, an affiliated store had $250,000. During the early 1970's, cooperatives and voluntaries grew rapidly. In 1972, there were 7,000 drugstores affiliated with this type of organization, nearly 14,000 by 1979.[10]

Technology and store operations improve

A number of technological innovations have been introduced into drugstore operations and became widespread by the late 1960's. Tape recorders, calculators, and code-dating machines are being used to improve store inventory procedures.[11] There has also been increased use of electronic price-marking machines and electronic prescription-filling and logging machines.[12] Electronic cash registers now tabulate and keep accurate sales and inventory records.[13]

Computers have played a growing role in nearly all of the industry's operations. Their impact upon productivity has been uncertain since their use became extensive in the late 1970's, a period of slow productivity growth. Computers are used for bookkeeping operations, data processing, and inventory control. In addition, they are being used to forecast seasonal needs in both stores and warehouses.[14] Computers have also been installed in prescription departments to handle the increased paperwork involved in third-party payment plans.[15]

Central purchasing and warehousing went hand in hand with the growth of chains, cooperatives, and voluntaries in the industry. Warehouses serving large numbers of retail outlets can afford advanced technological aids. Improved conveyor systems, elevators, mechanized waste disposal, and high capacity incinerators have been installed, and have cut labor requirements in warehousing operations.[16] Labor requirements have also been reduced in warehouse operations by the introduction of computers, used for documentation of warehouse to store transfers and inventory control.[17]

Drugstores, especially chains and affiliated stores, emphasize marketing techniques designed to increase shopper traffic. Advertising is one of the more important marketing devices, particularly in newspapers. Displays in the stores are regularly revised and improved to attract more impulse buying. Increased advertising, along with trends toward expanding product mix, have probably increased sales per customer stop.

There has been a trend toward the use of clerical employees in the pharmacy department.[18] This allows pharmacists to concentrate on their professional duties and may lead to output per hour gains. In 1961, the average chainstore filled 40 prescriptions a day, and by 1978, 135.[19]

Future trends

In the short run, future changes in drugstore industry productivity are uncertain and depend greatly upon changes in consumer purchasing power. The current productivity slowdown may continue because of the general falloff in economic activity in early 1980. However, in the long run, efforts to increase productivity will continue, with stores belonging to chains, cooperatives, and voluntaries continuing to grow to the detriment of small independent stores. Large independents will also probably continue to grow.[20] Efforts will be made to develop the optimum-size store, in terms of physical volume and product mix for the location.

Chainstores are expanding the types of products offered for sale and are placing more emphasis on productivity.[21] New product lines, such as in optical centers, are being added. There also appears to be a trend toward adding prescription departments to some proprietary stores.[22]

The use of computers and other electronic equipment within the industry is expected to continue to grow. Such equipment has proven to be highly useful in the pharmacy department and for inventory purposes. Electronic cash registers, which keep inventory records, have already made strong inroads into the industry and will continue to grow in use. However, computerized automatic checkout units, which have recently been introduced in the food store industry, are not expected to be used widely in drugstores in the near future. Drugstores do not have enough inventory turnover to justify the capital costs of this equipment. □

APPENDIX: Measurement techniques and limitations

Indexes of output per hour of all persons measure the change in the relationship between the output of an industry and the hours expended on that output. An index of output per hour is derived by dividing an index of output by an index of industry hours.

The preferred output index for retail trade industries would be obtained from data on quantities of the various goods sold by the industry, each weighted (that is, multiplied) by the employee-hours required to sell one unit of each good in some specified base period. This concept also embodies the services associated with moving the goods from the retail establishment to the consumer. Thus, those goods which require more retail labor are given more importance in the output index.

Data on the quantities of goods sold usually are not available for trade industries, including drugstores. Therefore, real output was estimated by removing the effects of changing price levels from the current dollar value of sales. Because an adjustment for changing price levels usually lowers the dollar value, such a series is usually referred to as a deflated value measure. Output measures based on deflated value have two major characteristics. First, shifts in sales can occur among products of different value which have the same unit labor requirements. (For example, if customers begin to purchase more store brands instead of "nationally advertised" brands, dollar sales will decrease if the store brand is priced lower.) Such a phenomenon can occur in times of economic recession, and the reverse may be true in times of economic prosperity. Thus, a change can occur in the output per hour index even if the labor required to sell the merchandise does not change.

FOOTNOTES

[1] The drugstore and proprietary store industry consists of establishments which are included on the basis of their usual trade designation rather than the more strict interpretation of commodities handled or services offered. It is designated industry 5912 in the 1972 Standard Industrial Classification Manual. Proprietary stores are like small drugstores without a prescription department and sometimes are called health and beauty aid stores.

[2] All average rates of change are based on the linear least squares trends of the logarithms of the index numbers.

[3] A chain comprises four retail stores or more and an independent, three stores or fewer. Most chains are owned by corporations and most independents by partnerships or proprietorships.

[4] Cooperatives are groups of independent retailers combined to gain wholesale buying power similar to chains. Voluntaries are groups of independent retailers organized by a wholesaler, who not only offers bulk-rate buying but also helps organize advertising and promotional needs.

Second, the sales level, both in current and constant dollars, reflects differences in unit values for identical products sold in different types of establishments. For example, the unit values associated with a product sold in a self-service "discount" store may be lower than the unit value associated with the same product sold in a store that provides many sales clerks and delivery service. The output measure, therefore, reflects changes in the level of service provided to customers, insofar as differences in unit values reflect the difference in service among the various types of establishments.

In addition to the deflated value technique, weights relating to labor importance (that is, employee-hours) were used to combine segments of the output index into a total output measure. These procedures result in a final output index that is closer, conceptually, to the preferred output measure.

The index of hours for the drugstore industry is for all persons—that is, hours for paid employees, partners and proprietors, and unpaid family workers. As in all of the output per hour measures published by Bureau of Labor Statistics, hours and employment in drugstores are each considered homogeneous and additive. Adequate information does not exist to weight the various types of labor separately.

The indexes of output per hour relate total output to one input—labor time. The indexes do not measure the specific contribution of labor, capital, or any other single factor. Rather, they reflect the joint effect of many interrelated influences such as changes in technology, capital investment, capacity utilization, store design and layout, skill and effort of the work force, managerial ability, and labor-management relations.

No explicit adjustments were made to the measure for drugstores to take into account increases or decreases in some services provided to the consumer. With the growth of large stores, there has been a continuation of the trend of self-service operations. This has shifted some of the hours in retailing from employee to consumer. However, data are not available to measure the impact of this change. Adjustments for changes in product quality are made to the extent that changes in quality have been accounted for in the price indexes used to deflate the current dollar value of sales.

The basic sources for the output series for this measure consist of the total sales data and sales by merchandise line data reported by the Department of Commerce. The deflators were developed using various Consumer Price Indexes published by BLS. The employee-hour weights were developed from data reported by BLS and the Department of Commerce.

The basic sources for the all-persons-hour series consist of data on employment and hours published by BLS, supplemented by data reported by the Internal Revenue Service and special tabulations compiled for BLS by the Bureau of the Census.

The profits regulation confers

Such economists as George Stigler have offered a theory to explain why, as a rule, "regulation is acquired by the industry and is designed and operated primarily for its benefit." All firms seek to maximize profits, and profits can be increased if competition is reduced or governmental subsidies are obtained. Though firms will not refuse subsidies if they are offered, subsidies have the disadvantage of increasing profitability without necessarily restricting entry into the industry. The prospect of these benefits will encourage new companies to form, increase competition, and thus reduce each firm's share of subsidies.

Far better are government regulations that restrict entry by requiring a firm or a member of an occupation to be licensed. By creating such political barriers to entry, the per-firm or per-person profits of truck operators, airline companies, dry cleaners, beauticians, doctors, lawyers, broadcasters, and other protected enterprises are increased . . .

Child care and family benefits: policies of six industrialized countries

Increasing numbers of mothers with very young children
continue to enter the labor force—
resulting in the emergence of a new family lifestyle
in the U.S. and five European countries;
expanded child-care services, cash benefits, and extended leave
are some of the options now available to working parents

SHEILA B. KAMERMAN

The pattern of segregated roles of men and women in work and family life has changed dramatically over the past two decades throughout the industrialized world as many more women, especially married mothers, have entered the labor market.[1] At present, more than half the children under 18 years of age in the United States have mothers in the labor force. Our country's most prevalent family type is now the two-parent, two-wage-earner family. If we add to this group the many single-parent families in which the sole parent (overwhelmingly likely to be a woman) works, then the "typical" American family in the 1980's is one with working parents.

"Working families" have previously established themselves as the norm in many European countries and are becoming prevalent in others. (See table 1.) Governments and employers are now beginning to react to this change by initiating activities in response. This article discusses the nature of the resultant lifestyle and analyzes the different types of benefits that the United States and several European countries have provided to help working parents to cope.

Clearly, work and family life can no longer be viewed as separate domains. This is especially true because of the high U.S. labor force participation rates of young women of childbearing age, 25 to 34 years. In 1978, the highest rate ever for this age group were in the labor force—62 percent—which was nearly the highest rate for women of any age. Included among these were close to 40 percent of those mothers with children under age 3 (41 percent in 1979). (See table 2.) Therefore, women are now working during the peak of their childbearing years, whereas in the past, it was common to stay at home once one married or had children.

Society places demands on the individual

As these changes occur, two issues emerge of central importance:

- How are adults, regardless of gender, likely to manage increasingly demanding daily routines involving home as well as job responsibilities?
- How will society respond to individual family lifestyles in which most adults are likely to be in the labor force during the same years that they are at the peak of their childbearing and child rearing responsibilities?

Given an earlier history of growth in female labor force participation rates, we studied several European countries to explore alternative public policy responses to the growing proportion of working families. We chose five countries with similar levels of industrializa-

tion and the following characteristics: (1) about half of the adult women or more are in the labor force, (2) where women with school-age children are expected to be in the work force and a similar pattern is emerging for those with preschool-age children, and (3) where recent government attention has focused on the problems of working parents with children under age 3—when the demands of child-care responsibilities are the heaviest and the tension between work and family life is most severe, and most visible.[2] The countries were selected initially because each suggested a distinctive policy stance:

- supporting mothers at home (Hungary)
- supporting mothers in the labor force (German Democratic Republic)
- supporting parental choice in selecting how to allocate work and family roles (France)
- supporting the opportunity for all adults to manage work and family roles simultaneously (Sweden)
- assuming that adults make personal and private arrangements in adapting to this lifestyle (Federal Republic of Germany)

Over time, there has been some tendency towards convergence among these countries although the particular emphasis still varies.

Countries have similar problems

As we explore what is occuring in other countries, there is the emergence of a common list of problems needing attention. Although not all these needs arise simultaneously in every country, gradually the lists become very similar.

The concerns tend to be in 1 of 4 areas:

The need for some financial assistance to help with the costs of childrearing.

The need to care for children while parents are away from home at work.

The need to make possible a more equitable sharing between men and women of home and family tasks and responsibilities.

Table 1. Labor force participation rates of women by age of child, 1976

[In percent]

Country	0-3 years	3-6 years	School age
France	43	44	48
Federal Republic of Germany	32	34	41
German Democratic Republic	80	85	85
Hungary	82[1]	75	75
Sweden	58	64	78
United States	35	46	56

[1] Thirty-three percent excluding women home on child-care leave; 82 percent if women home on child-care leave are included.

The need to facilitate a better balance between work and home so that adults may fulfill their roles as parents without either gender suffering penalties in the labor market.

Emergence of family benefits

The European countries have a long history of acknowledging that children are a major societal resource and that the whole society should share in the costs of rearing them. The cash benefits provided families with children are increasingly being referred to as a "family benefit system", part of a country's social security system but distinguishable from traditional social insurance and assistance.

This principle was reflected first in family or child allowances, in the form of cash benefits provided monthly (or weekly) for every child (or second or subsequent children), usually regardless of family income and the labor force attachment of the parents. Family allowances began first in France in the 1930's; in Sweden, Finland, and several other countries by the 1940's. By now, 67 countries, including all the developed countries except the United States, provide such a supplement to the income of adults who are rearing children. The benefits, which are usually tax free, range in the western European countries from $300 to $600 or more per year. In both eastern and western Europe, these benefits represent a significant percentage of median wages, usually between 5 and 10 percent (where there is one child) and substantially higher for single mothers (whose wages are likely to be low), and families with several children.

Regardless of the specifics, these benefits provide a significant supplementary contribution to family income, particularly for low and median wage earners, for whom the cost of rearing even two children can be a financial burden. They reflect a recognition of the lack of correspondence between wages and family responsibilities—and of the societies' stakes in child rearing.

An alternative approach to providing income supplementation to families with children is the provision of a similar child benefit through the tax system. In contrast to the $1,000 tax exemption for dependents in the United States (many countries have such exemptions), of value only to those who pay taxes and of more value to those with higher incomes, the child benefit tax credit is provided at a fixed amount and paid to families at all income levels. Furthermore, it is refundable to those whose incomes are so low as to preclude any tax obligations.

France provides an additional, income-tested special supplement to low- and middle-income families with children under age 3 or with three children or more. The assumption here is that very young or many children make it increasingly unlikely that a woman can be in the labor force and, therefore, such families may suffer an extra financial hardship in trying to manage, even briefly, on the wages of one adult.

If income supplementation for families with children is a longstanding policy in many European countries, defining childbirth as a social risk which may result in temporary unemployment, and providing a cash benefit as an earnings replacement under such circumstances, is a much more recent policy. Accordingly, there are two parallel policies in most European countries to protect family income at the time of childbirth in those families where mothers are employed.

First, there is a guarantee of a right, around the time of childbirth, to leave work for a minimum of 3 months (Denmark and several other countries), a maximum of 3 years (Hungary), and an average of 6 months to 1 year, with the assurance of full job protection, seniority, and pension entitlement. In Sweden, this right can be shared equally by both parents. Some countries have supplementary rights to extended leaves, but with more limited protection.

Social security covers maternity leave

The second, parallel policy is the provision (in connection with leave right before childbirth and after it) of a cash benefit through the social security system, replacing the full wage covered under social security (or a significant portion of it). These benefits are available to almost all employed women of childbearing age and under certain circumstances—or in certain countries, such as Sweden—to their husbands, too. The benefits may be tax free or considered as taxable income.

In effect, these two parallel policies comprise what is usually described as the statutory provision of maternity or parental benefits and leaves. The key portion of the policy is the leave from work which is covered by a cash benefit replacing earnings forgone at the time of childbirth. In France, this covers 16 weeks, including 6 weeks before childbirth, and is equal to full wage replacement. In West Germany, 7½ months are covered, the first 14 weeks with a statutory flat rate benefit equal to the wage of about 70 percent of the working women, but supplemented to full wage by the employer for those women earning more, and the remainder of the time at the statutory benefit level only. The German Democratic Republic provides full wage replacement for 26 weeks (and for an additional 26 weeks at the birth of second and subsequent children). Sweden is unique in providing a benefit covering 9 months, available to either parent, and capable of being prorated so that parents can use the benefits to cover full-time work, half-time work, or three-quarter time, while the children are young. This enables parents to share all child-care responsibilities between them for the child's first year to year and a half of life.

The Hungarians provide an unusual benefit from the end of maternity leave until the child is 3 years old. Here, the mother is entitled to a cash allowance equal to about 40 percent of an average female wage, as long as she remains at home to care for her child. During this time, she continues to be defined as a member of the labor force and therefore maintains her seniority and pension entitlements, while assured of job protection.

These benefits are all contingent on prior labor force attachment and represent some attempt by the larger society to replace all or a significant portion of earnings at the time of childbirth and for some limited period of child-caring time thereafter. Although not yet widely implemented, one growing trend in Europe seems to be to extend these rights to both parents and to parents of adopted children.

The benefits thus far discussed *supplement* incomes of parents rearing children or *replace* income in connection with the period right after childbirth. Very few countries provide a *substitute* for earned income beyond the time a child is age 3, and the scale and scope of Aid to Families with Dependent Children in the United States is rare, even though Britain, West Germany, Canada, Israel, and Sweden do give some cash benefits to single mothers with low incomes. Canada and Britain have the closest equivalent of the U.S. system.

Meeting child-care needs

The paid leaves from work following childbirth range from 3 months to 3 years. In most countries, 6 months is typical, with growing discussions about extending the leave to 9 months or a maximum of 1 year. All European countries permit additional unpaid but job-protected leaves of somewhere between 6 months and 2 years, although few women avail themselves of this benefit. This means that most working families in Europe need some form of out-of-home child-care service beginning when a child is about 6 months old, except where one adult works part time. Compulsory school usually begins at age 6, as it does in the United States; but in Britain 5 years is the age of entry, and in Sweden, Poland, and several other countries it is age 7, although all 6 year-olds in these countries already attend a preschool.

For the typical working family in Europe, all day, out-of-home child-care services are needed for children who are about 6 months to 6 years old. What is provided for these children now?

Most children age 3 to 6 years are already attending a free public preschool program, based in the educational system, covering the normal school day and attend it on a voluntary basis regardless of whether or not they have "working mothers."

France has the most extensive such provision in any European country—serving 95 percent of the 3 to 6 year-old age group. Moreover, 32 percent of the 2 year-olds (largely those age 2½ are now attending and the programs are expected to serve close to half this age group within the next 2 years. (Hungary and West Germany also recently have opened kindergarten to the 2 year-olds as space has become available.)

Belgium has a similar program serving about 95 percent of its 3 to 6 year-olds. West Germany serves about 75 percent of this age group in such a program, although it is still largely for half a day (8:00–1:00), as in all primary schools in Germany. (But a "long school day" is becoming more prevalent, especially in schools located in working class neighborhoods.) Italy has place for about 70 percent of the age group, but most of the eastern European countries serve between 75 and 90 percent of this group in full-day preschool programs, with the highest coverage in East Germany. Sweden has only a little more than half this age group in their child-care programs which, in contrast to the others, are part of an independent, free-standing program, not part of the public education system.

Preschools viewed as healthy

Most of Europe assumes that children from age 3 (and increasingly from age 2½ or 2) will attend a preschool program, because these programs are viewed as being good for children, whether or not mothers work. Incidentally, as does primary school, preschools fulfill important child-care needs of working parents. Thus, for most working families in Europe, child care is available from the age of 2, 2½, or 3 on, at least to cover the normal school day.

Only the United States, Britain, Canada, and Israel continue to maintain an artificial distinction between child care under social welfare auspices and that under education auspices; and only these countries continue to support two parallel systems for all children under compulsory school age. In Israel about 90 percent of the 3 to 5 year-olds already attend a preschool in any case, although these are largely under private auspices as they are in the United States, where more than half of this age group now attend such schools.

Except for Sweden and Finland, which have a separate but integrated special child-care program for children up to age 7, day care is viewed largely as the care of children under age 3 in Europe, and in most countries is administrated under health ministry or department auspices. Infant and toddler care for children of working families is not nearly as extensive as care for children from about the age of 2 or 3 and older.

East Germany has by far the most extensive group provision for infants and toddlers—with 60 percent between the ages of 6 months and 3 years in care (48 percent of children from birth to age 3), and plans to expand provision to include space for 70 percent. France leads among the western countries, with about one-third of the under 3's in some kind of out-of-home care. The public preschool program serves a significant number of 2 year-olds and another small percentage are served in publicly-subsidized day-care centers, subject to income-related fees. The largest group is cared for by licensed family day-care mothers; France has the most extensive provision of this type of care. Hungary has only a limited amount of group care, because its primary policy focus for the under 3's is to subsidize the mothers' own care. In contrast, Sweden has an official policy of expanding such coverage to meet most existing needs. However, only about 14 percent of the children under age 3 can be served in publicly subsidized care today, while an equivalent amount are still cared for in private, informal, family day-care arrangements. (See table 3 for more details.)

Family day care versus group care

Thus, most countries still have a long way to go before there are enough out-of-home places to care for children aged 6 months to 3 years, while their mothers are at work, but the policy is clear for the 2 year-olds already and emerging, too, for younger children. (See table 3.) While family day care dominates currently, es-

Table 3. Type of care provided for young children in six countries, 1975

[In percent]

Country	Under age 3			Ages 3 to 6 in preschool[1]
	Total [In thousands]	Type of care [In percent]		
		Center care	Family day care	
Sweden	323,463	7	16	28
France	2,400,000	11	20	95+
German Democratic Republic	532,048	46	0	85
Hungary	519,000	12	0	78
Federal Republic of Germany	1,800,000	4[2]	5[2]	75+
United States	9,700,000	3–4	7	64

[1] The 3 to 6 year-old coverage for the U.S. includes preschool, kindergarten, and day care, much of it part-day.

[2] Children of working mothers only.

Source: Sheila B. Kamerman and Alfred J. Kahn, *Child-Care, Family Benefits and Working Parents* (New York: Columbia University Press, forthcoming).

pecially given the unlicensed, unregulated provision, many experts now assume group care will ultimately predominate as more and more women are working and the potential labor force for family day care disappears and the costs increase (as standards are raised). If and when this occurs, family day care may be available, but is likely to be viewed as a high-priced therapeutic program intended for children with special needs.

Before- and after-school care, for the pre- and primary school age children of working parents when school hours and days do not coincide with work schedules, is recognized as a universal need. No country provides adequate coverage or even has systematic data indicating where children of this age are cared for now. Several of the eastern European countries do provide extensive after-school programs or a long school day. French schools, especially those in large metropolitan areas and in working class districts, often provide children with supervised care before and after school hours and on holidays. The Swedes are encouraging the establishment of separate after-school programs called leisure-time centers, often located adjacent to the preschool programs where children of different ages have an opportunity for interchange in "sibling groups." Similar provision is expected to grow in Germany. Such programs are important and their scarcity represents a significant weakness of child-care services.

None of the research reported here covered intra-familial adaptations or workplace response to the new realities of work and family life.[3] We would note, however, that for some years policies in many countries have supported, or been predicated on, traditional role assignments within the family. Modifications will be necessary if intrafamilial equity is to increase.

Most adaptation in the home will reflect the values and behavioral changes of the adults living there, but there is evidence (particularly among the younger cohorts) that as women have entered the labor market, men do participate more actively in home and family responsibilities. We assume that such changes also would affect children: they may begin to get more attention from their fathers than they have previously.

Table 4. Child-care benefits and services package (major components) by country

Benefits and services	Hungary	France	German Democratic Republic	Sweden	Federal Republic of Germany	United States
BENEFITS						
Cash: Income replacement	Maternity	Maternity	Maternity	Parental	Maternity	......
			Supplementary maternity			......
	To care for an ill child at home	......	To care for an ill child at home	To care for an ill child at home	To care for an ill child at home	......
Income substitution	Child-care allowance	......	......	......	......	Aid to Families with Dependent Children
Income supplementation	Family allowance Housing allowance Child health services	Family allowance Housing allowance Child health services	Family allowance Housing allowance Child health services	Child allowance Housing allowance Child health services	Child allowance Housing allowance Child health services	......
		Complementary family allowance Single parent allowance				
		Family-based tax system		Tax allowance for dependents	Child-care tax credit	Tax allowances for dependents Earned income tax credit Child-care tax credit
Employment: Right to leave work and job security	Maternity (20 weeks) Child care up to child's 3rd birthday	Maternity (16 weeks) Parental education (unpaid) 2 years	Maternity (26 weeks) Supplementary (26 weeks)	Parental (9 months) Unpaid 18 months; 6-hour day up to child's 8th birthday	Maternity (7½ months)	......
SERVICES (1975) Percentage of cohort 0–3 in out-of-home-care	12 percent (Mainly 1/2 to 3 year-olds)	31 percent	50 percent (80% of 1 to 2 year-olds)	23 percent	3 percent	10–11 percent
Major care mode	Center care (almost completely)	Co-equal in policy but family day care predominates	Center care (completely)	Policy favors center care but present reality is family day care primarily	Family day care primarily in policy but co-equal in provision	Family day care predominates

Employers provide important rights

The workplace itself remains an essential arena for change; here we refer both to marketplace and statutory benefits and to the organization of work. Special attention is currently being directed in a number of countries to the social security status of women (for example, in the work force, homemakers, and widows). We already have described Swedish parent insurance as a major innovation. Among countries making provisions for supplementary but unpaid post-childbirth leaves, France offers a 2-year leave for either parent under certain circumstances. Norway provides a parental leave of up to 1 year. Sweden permits an unpaid leave after the conclusion of the parent insurance benefit until a child is 18 months old, and guarantees parents the right to work part time (a 6-hour day) until their child is age 8. Assuring workers a right to take a specified number of days off from work to care for an ill child at home, or to visit a child in school, while receiving the same wages they would receive if they were ill themselves, is receiving attention in Europe, too.

There are also efforts by industry to modify employment practices or to provide selected benefits through labor contracts or as part of private fringe benefit systems. Similarly, there is growing experience with flexitime and other alternative work schedules such as part-time and shared work.

IF ADULTS ARE to manage work and family life simultaneously, attention will have to be paid to all four arenas we have discussed.

Government policies have been the major focus of what we have studied in Europe; and one major finding, apart from the specifics mentioned above, is the trend towards the development of family or child policy "packages" that go far beyond any single policy strategy. The European experience clearly suggests the need for a policy strategy that includes income transfers, child-care services, and employment policies as central elements even if the specifics may vary as they are modified to fit the ideology, demography, and needs of each country. (See table 4 for the components of these policy "packages" in six countries.)

This discussion is predicated on the recognition that employment and labor market policies are a cornerstone of social policy in industrialized countries. Work remains the primary role for all adults and a central ethic. It seems likely that unless it becomes possible for adults to manage work and family life without undue strain for themselves and their children, society will suffer a significant productivity loss in the labor market and economy, and perhaps an even more important loss in the quantity and quality of future generations. The developments now occurring in other countries can provide the basis for discussion in the United States. ☐

Research Summaries

Results of experimental study on flexitime and family life

Richard A. Winett and Michael S. Neale

Federal workers with young children, when given the perogative of changing their work schedule, choose to arrive at and depart from work earlier, according to two small experimental studies of flexible workhours at two Government agencies. The change in work schedules allowed the workers to increase the time spent with their families in the evening and led to less perceived difficulty in engaging in familial, recreational, and educational activities and household chores.[1]

Time spent with the family in the morning was reduced for workers who changed their schedule, but this time was never extensive (about 35 minutes) and rarely was it rated as an "enjoyable" time. When scored on a 5-point scale (where "dislike a great deal" equals 1 point and "enjoy a great deal" equals 5), morning-time activities had a mean of 2.9, while evening activities were rated 3.8.

Overall, the flexitime program received positive ratings (about 4.5 out of a possible 5.0) and few managerial problems were reported. Workers who remained on regular hours were either limited to these hours by commuter arrangements, spouse hours, or simply preferred the regular hours. The altered schedules did not change workers' weekend activities or the division of labor at home (childcare and home chores).

Two experimental, longitudinal studies in two large Federal agencies addressed the issue of the effects of flexitime on families with young children. This report briefly describes several methodological aspects of the studies and the main results.

Advantages of experimental methods

Experimental research methods generally follow several strategies including carefully defining, recording, and monitoring behavior over a relatively long period of time; collecting reasonable baseline data for comparison purposes; and using a true experimental or quasi-experimental design (suitable comparison group) to evaluate effects. For true experimental flexitime studies, workers or departments are randomly assigned to flexitime or usual work schedules. Completely random assignment often is not feasible, necessitating that the test become a quasi-experiment, with results that still are interpretable.[2] Experimental strategies often involve a series of relatively small-scale studies designed to replicate and expand upon previous findings.[3]

What are the advantages of the experimental approach, compared with other methods (for example, surveying thousands of people at one time)? Basically, the advantage is that cause and effect relationships are the product of the research. Cross-sectional surveys (for example, surveying those on flexitime and those not on flexitime) obviously serve important functions by describing events and attitudes, but such research cannot be used to infer causality. This is true of any correlational research.

The best experimental evaluations are often designed so that the same individuals are observed under several conditions. For example, the same people may be studied as they systematically are shifted to different kinds of flexible work schedules. With this design, it is possible to identify critical elements of a program that are beneficial or detrimental to employees, management, and the overall agency. When properly conducted, the experimental approach also yields important feedback on a program's effects, providing a mechanism to change a program for maximum benefits.

Although our studies were exploratory, two hypotheses were tested. We predicted that change in the work schedule would result in (a) more time spent with the worker's family, and (b) less difficulty in performing home chores and other activities. In other words, we believed that even in limited flexitime programs, altering the work schedule would not simply lead to a change in time when activities were performed, but would result in the reproportioning of time, thus, facilitating some family functions. Organizational and political constraints did not permit us to conduct true-experiments; a quasi-experimental, nonequivalent control group design was used—an evaluation strategy that is becoming more popular among social scientists.[4]

Richard A. Winett is associate professor, Psychology Department, Virginia Polytechnic Institute and State University and Michael S. Neale is a graduate student at Yale University. Data for this article were collected while the authors were at the Institute for Behavioral Research, Inc., Silver Spring, Md. The research was funded by the Center for the Study of Metropolitan Problems of the National Institute of Mental Health.

The experiments and its participants

The experiments included secretarial and administrative personnel at the Washington, D.C., headquarters of the two Federal agencies. Thirty-two of Agency A's 600 employees participated and 65 of Agency B's 2,200 employees participated. Participants had at least one child under 13 years. The participants represented a cross-section of job levels, had an average annual salary in 1978 of approximately $20,000 and had been in their jobs an average of 5.7 years. They were allowed to complete the research forms during work hours and received $75 for home interviews which generally focused on the division of childcare and household chores.

At Agency A, the original work schedule set arrival time at 8:45 a.m., a half-hour lunch between 11:30 a.m. and 12:30 p.m., and departure at 5:15 p.m. Under the flexitime system, workers could arrive any time between 7:30 and 9:30 in the morning and leave (depending on arrival time) between 4 and 6 in the evening. The 30-minute lunch could be taken between 11:30 a.m. and 2 p.m., and "core" times were 9:30–11:30 a.m. and 2–4 p.m. An 8-hour day was required with no carryover of hours between days or weeks. Potentially, on flexitime, a worker could adopt a schedule that was 75 minutes earlier or 45 minutes later than the regular working hours. Workers were required to stay with a new schedule for at least one pay period. A sign-in, sign-out system was used, rather than a time clock or other equipment. Data were collected for 5 weeks before the flexitime program started and were collected for 14 weeks during the program.

A similar flexitime system was adopted at Agency B. However, the regular work hours at this agency were 8:15 a.m. to 4:45 p.m.; therefore, the maximum potential change under flexitime was 45 minutes earlier or later. Data were collected for 7 weeks prior to the start of flexitime and for 28 weeks during the program.

In each agency, alteration of work schedule followed three distinct patterns: (1) employees altered their schedule by a designated criterion and remained on this fixed flexible schedule for the duration of the study, (2) employees retained their original schedule, and (3) employees varied their schedule—sometimes arriving and departing work early, sometimes late, and sometimes working regular work hours—true flexitime. Because the true flexitime group only varied their schedule minimally and showed no significant changes on time or rating measures at Agency A and showed only minimal changes at Agency B, only data for those working fixed flexible hours and those keeping the original work schedules are presented in this report.

The main measures of the two studies were time-activity logs and a 15-item questionnaire. The time-activity log was completed about twice per week and required participants to indicate on a standard form for every activity the time it began and ended; the setting in which the activity took place; the people who were present during the activity, and secondary activities (for example, watching television while eating dinner). Each activity was rated on a 5-point scale from 1 ("dislike a great deal") to 5 ("enjoy a great deal").

Participants at Agency A received only minimal training on the use of the log, and no reliability checks were made on the data. At Agency B, participants received training and more than 2,000 checks of the reliability of the data were made using four techniques: random phone calls to participants; correspondence of log data to a known event; log reports of spouse collected at a later date; and correspondence of office archival data to log data. Reliability of log information was 80 percent.

At Agency A, log data were reduced to eight standard categories (morning or evening time with spouse, children, spouse and children, or alone). At Agency B, "time at work" was added to these eight categories and log data were reduced to nine main categories, plus 37 subcategories (for example, dinner, exercise, watching television).

Once a week at Agency A, or semimonthly at Agency B, participants completed a questionnaire on which they rated (on a 7-point scale) the ease or difficulty involved in coordinating aspects of work and family life, particularly with respect to hours of work (for example, "The hours I work make spending time in the evening with my child(ren) _______"). Additional questions were asked to ascertain any change in status at work or conditions at home that could interact with work schedule and home-life relationships. The purpose of the scale was to pinpoint situations affected by the flexitime program, as perceived by the participant. The scale could also be used to confirm the importance of time allocation changes derived from the logs.

Several additional research methods were used. Sample participants and their spouses (or single parents alone) were interviewed together (once at Agency A and three times at Agency B), following a standard interview schedule that focused on the division of childcare and household chores. The purposes of the interviews were to ascertain if specific divisions of childcare and household chores were predictive of adopting flexitime and, if at Agency B, changes occurred as a result of adopting flexitime.

A checklist was used to examine changes in weekend activities alone and with family members and another measure focused on particular problems experienced by two-earner, single-parent, or one-earner families. Finally, surveys were conducted with a random sample of employees not included in the sample to gain an impression of the effects of flexitime at the work site. The results of these additional measures are not presented formally here, but are discussed as they pertain to the log or interview data.

Experience at Agency A

Workers who opted for fixed flexible hours at Agency A were younger, with fewer and younger children, and fewer years on the job than those who kept the regular hours (see table 1). Sample participants were at a mean mid-level for their jobs and about one-third were men.

Log data. Log data was categorized by coders as engaged in with spouse, with children, with spouse and children, or alone. An average time per activity was then calculated (see table 2). The group on fixed flexible hours arose about 38 minutes earlier and arrived at work about 56 minutes earlier. However, bedtime for them was only 13 minutes earlier. There was almost no change for those who remained on regular hours.

Evening time with spouse and children and with spouse alone differed significantly between the two groups. Such differences may have resulted because of the difference in age of the groups' children, with the presence of older children reducing the necessity of both parents spending time with children. However, the analysis indicates that time with children increased for the workers on fixed flexible hours, and decreased for those who remained on regular hours. Both work groups showed an increase in time spent with spouse and children, and time with spouse increased for those on fixed flexible hours and decreased for those on regular hours. Overall, family time increased by more than an hour for workers on fixed flexible hours and remained about the same for those on regular hours. Seven of ten workers on fixed flexible hours increased the time they spent with their families by more than 35 percent, compared with only 2 of 11 workers who remained on regular hours. There was no significant difference between the two groups in change in time for the evening alone category and morning categories.

Table 1. Profile of study participants

[In means]

Characteristic	Flexitime	Regular time
Agency A:		
Men	3.0	4.0
Women	7.0	7.0
Age	28.1	32.4
Age of spouse	29.0	33.2
Number of children	1.3	1.8
Age of children	4.1	6.8
Years on job	3.7	5.2
Families of male participants:		
Two earner	2.0	2.0
Single earner (male)	1.0	1.0
Part-time working wife	.0	1.0
Families of female participants:		
Two earner	6.0	4.0
Single parent	1.0	3.0
Agency B:		
Men	13.0	14.0
Women	11.0	12.0
Age	33.4	34.4
Age of spouse	31.1	32.6
Number of children	1.8	1.8
Age of children	5.7	5.9
Years on job	5.3	7.4
Families of male participants:		
Two earner	4.0	2.0
Single earner (male)	7.0	10.0
Part-time working wife	2.0	2.0
Families of female participants:		
Two earner	5.0	5.0
Single parent	6.0	7.0

Table 2. Time data for participants of flexitime experiment at Agency A

[In means]

Item	Fixed flexible hours group		Regular hours group	
	Before flexitime	During flexitime	Before flexitime	During flexitime
Time arise	6.48	[1]5.83	6.51	6.57

Start work	8.68	[1]7.75	8.58	8.57
Time spent (in minutes):				
With children	58	[1]82	88	68
With spouse	31	[2]37	84	71
With spouse and children	88	130	40	64
With family, overall	177	[1]249	212	203

[1] Significant at 0.01.
[2] Significant at 0.05.

Questionnaire data. A mean score for each item in the questionnaire was obtained for each participant before and during flexitime periods. The pre-flexitime scores of the two groups did not differ significantly. However, during the flexitime period, significant differences were found for eight items for workers on fixed flexible hours. They perceived that it was easier to spend afternoon time with their child(ren), and spend time with their spouse during the week; see friends during the week; and in the evening spend time with their child(ren), pursue additional education, engage in recreation and hobbies, complete shopping and chores, or just relax.

Experience at Agency B

Those who chose flexible hours at Agency B and those who remained on regular hours had similar family characteristics (see table 1). However, those who worked regular hours had more years on the job. Also, this group included five supervisory personnel, whereas the fixed flexitime group had no supervisors. Participants were at a mean mid-job level and more than half of them were men.

Log data. Mean time for each participant was calculated before flexitime and for three periods during flexitime: spring, summer, and fall. The phases allowed for

examination of seasonal effects and corresponded to the school attendance of children.

During flexitime the 24 participants on fixed flexible hours altered their mean time of starting work from 8:15 a.m. to 7:37 a.m. and departed from work at 4:11 p.m. instead of 4:45. The mean arising time became earlier for the workers on fixed flexible hours (by about 12 minutes), while those keeping regular hours arose about 5 minutes later. Workers on fixed flexible hours went to bed 8 minutes earlier; the other group went to bed 7 minutes later (see table 3).

Time with spouse increased during the summer for those on regular hours. Time spent with children increased significantly for workers on fixed flexible hours during the spring and summer. The time they spent with their spouse and children increased during the spring, summer, and fall.

Overall time spent with family increased about 37 minutes for those on fixed flexible hours, compared with an increase of only about 5 minutes for those on regular hours. Both groups tended to increase family-related time during the summer. Generally, differences between groups somewhat dissipated by the fall. The increase in time spent with spouse during the summer for workers on regular hours may be attributed to the presence of supervisors in this group. During the summer, supervisors were involved in labor negotiations and tended to arrive home later than usual. Their later arrival at home also may have contributed to the large reduction in time with children during the summer for the group who kept regular hours. When supervisors were removed from the sample, there was no difference in time with spouse during the summer.

Workers on fixed flexitime showed a greater mean percentage of participants increasing their time spent with children and spouse and with the family in the evening, than workers on regular hours. Time spent with family differed by type of family; for example, men from single-earner families spent less evening time with their children than women from two-earner families. There were no differences between the two groups on other items involving work time. Generally, the group on regular hours worked about 13 minutes longer each day.

Although the workers on fixed flexible hours took longer to commute to work before flexitime, the difference was not significant and can be attributed to the slightly longer distance traveled to and from work. During flexitime, time spent commuting decreased for this group—commuting home time decreased by about 5 minutes, while for those on regular hours, commuting home time increased by about 2 minutes.

An examination of the modes of commuting (for example, car, carpool, bus) indicated that those on regular hours decreased their use of carpools by about 10 percent and increased their use of other methods. However, carpool use did not decrease for those on fixed flexible hours, suggesting that their decrease in time commuting home was not accomplished by changing transportation mode (for example, increased use of private cars).

Questionnaire data. Workers on fixed flexible hours at Agency B rated the same items on the questionnaire as "easier" during flexitime as at Agency A. Ratings of commuting time showed minimal change, possibly indicating that the "real" time saved in commuting was not perceived as meaningful, or was not noticeable. ☐

FOOTNOTES

[1] Similarly, Federal workers on flexible schedules in 1977 reported that such schedules allowed them to spend more time with their families. See "Concept wins converts at Federal agency," *Monthly Labor Review*, February 1977, pp. 71–74.

Record white-collar pay increase closes decade but trails inflation

FELICE PORTER

White-collar salaries, as reported by the Bureau of Labor Statistics' survey of professional, administrative, technical, and clerical pay rose a record 9.1 percent during the year ended March 1980.[1] This was the second time that increases hit 9 percent in a decade that saw white-collar salaries double, while prices slightly exceeded that rate—up 106 percent. (See table 1.) These movements contrasted to those of the preceding decade when white-collar salaries went up roughly 46 percent and prices, approximately 30 percent.

Not all white-collar salaries increased at the same rate. During the first half of the 1970's, for example, clerical salaries outpaced those of professional, administrative, and technical personnel; in the last half the reverse was true. The key salary increase periods for clerical workers outpacing professional, administrative, and technical workers were 1971–72 and 1974–75. For the latter group, the key periods were 1976–77, 1977–78, and 1979–80, and in this last year their salaries rose an unprecedented 9.3 percent.

From March 1979 to March 1980, 7 of the 13 survey occupations comprising the professional, administrative, and technical support group (see below) had the largest annual increases for their respective occupations since the survey began in 1960. These occupations were auditors, chief accountants, attorneys, directors of personnel, engineers, engineering technicians, and drafters. During the same period, only two clerical jobs—accounting clerks and secretaries (not surveyed in 1975)—registered the highest salary gains in two decades. For the clerical group as a whole, average salaries rose 8.8 percent in the 1979–80 period. Increases for occupations within both groups are listed in the following tabulation:

Professional, administrative, and technical support occupations		*Clerical occupations*	
Accountants	9.2	Accounting clerks	8.9
Public accountants	4.2	File clerks	9.3
Auditors	8.8	Key entry operators	9.1
Chief accountants	11.3	Messengers	5.5
Attorneys	9.3	Personnel clerks	8.6
Buyers	8.1	Secretaries	9.6
Job analysts	8.1	Stenographers	10.1
Directors of personnel	11.2	Typists	8.9
Chemists	9.8		
Engineers	9.8		
Computer operators	8.3		
Engineering technicians	11.0		
Drafters	11.8		

Table 1. Percent increases of average salaries, 1970–80

1979–1980	9.1	9.3	8.8	14.7
1970–1975	37.9	36.6	38.9	35.7
1975–1980	45.2	45.7	44.1	52.0

[1] A March payroll period has been used since the 1972 survey. The 1970 and 1971 surveys had a June reference period for all occupations.

[2] The wage survey data did not represent a 12-month period due to a change in survey timing. Data have been prorated to represent a 12-month interval.

[3] Changes in the Consumer Price Index represent a June to June period for 1970–71 and 1971–72 and a March to March period for all subsequent years shown.

[4] This period is June 1970 to March 1980.

NOTE: Mandatory wage and price controls were in effect for most industries from August 31, 1971 to April 30, 1974.

The 91 occupational work levels covered by the March 1980 survey represented a wide range of duties and responsibilities. Salaries for professional and administrative occupations averaged from $1,238 per month for buyers I and auditors I (the lowest levels of these two job series) to $5,053 per month for attorneys VI (the top of the attorney series). (See table 2.) At the other end of the salary spectrum, clericals averaged from $657 per month for file clerks performing routine filing, to $1,653 for level V personnel clerks. The latter, generally found in large manufacturing establishments, function more as staff assistants or technicians than as clerical workers.

Despite wide differences in the occupational pay levels reported by the survey, the findings show that salary averages for jobs of equivalent levels of work fall within relatively narrow bands. For example, monthly averages for the following work-level equivalents barely spanned $300 in March 1980, with the exception of public accountant III.[3]

Accountant IV	$2,180
Auditor IV	2,232
Attorney II	2,129
Buyer IV	2,315
Chemist IV	2,307
Chief accountant I	2,362
Director of personnel I	2,060
Engineer IV	2,374
Job analyst IV	2,193
Public accountant III	1,650

Felice Porter is an economist in the Office of Wages and Industrial Relations, Bureau of Labor Statistics.

Table 2. Average salaries of employees in selected white-collar occupations in private establishments, March 1980

Occupation and level	Number of employees[1]	Mean	Monthly salaries[2]		
			Median	Middle range[3]	
				1st quartile	3rd quartile
ACCOUNTANTS AND AUDITORS					
Accountants I	12,142	$1,262	$1,245	$1,130	$1,374
Accountants II	19,560	1,536	1,475	1,333	1,699
Accountants III	32,903	1,775	1,733	1,558	1,962
Accountants IV	20,312	2,180	2,144	1,958	2,388
Accountants V	7,452	2,661	2,624	2,405	2,899
Accountants VI	1,100	3,358	3,290	3,043	3,665
Auditors I	1,770	1,238	1,255	1,090	1,333

[1] Occupational employment estimates relate to the total of all establishments within the survey and not to the number actually surveyed.

[2] Salaries reported relate to the standard salaries that were paid for standard work schedules, that is, the straight-time salary corresponding to the employee's normal work schedule excluding overtime hours. Nonproduction bonuses are excluded, but cost-of-living bonuses and incentive payments are included.

[3] The middle range (interquartile) is the central part of the array excluding the upper and lower fourths of the employee distribution.

NOTE: The following occupational levels were surveyed but data did not meet publication criteria: Chief accountant V, director of personnel V, and chemist VIII.

Other job groupings by work level showed similar results. Such salary structures produced by the survey do not necessarily correspond to those found within individual firms. They do not take into account the effect of industry mix on the averages or the disproportionate contribution of employment to any of the job categories by high-paying or low-paying firms. What the survey structures do show is that companies, on the average, pay in relation to the level of duties and responsibilities and recognize the equivalencies that exist among a wide range of occupations within broad categories, such as professional and administrative workers.

A more detailed analysis of white-collar salaries and complete survey results are contained in a bulletin, *National Survey of Professional, Administrative, Technical, and Clerical Pay, March 1980.* □

FOOTNOTES

[1] The survey is conducted annually with a March reference period in metropolitan areas and nonmetropolitan counties in the United States, except Alaska and Hawaii. It currently covers establishments employing a minimum of either 50, 100, or 250 employees, depending upon the private-sector industry.

[2] For a complete grouping of equivalent job levels covered by the survey, see *National Survey of Professional, Administrative, Technical, and Clerical Pay, March 1980,* (BLS Bulletin 2081), table D-1.

[3] The survey's public accountant job is unique on several counts. The job is found in only one industry classification, that of accounting, auditing, and bookkeeping services. The public accountant job as defined by the survey is often used as a career path for workers gaining experience for a public accounting certification or those working towards partnerships in public accounting firms. The salaries reported by the survey do not reflect nonproduction bonuses which are commonly provided to public accountants. (It should be noted that in the survey coding structure, the level designations among various accounting jobs are not synonymous, for example, public accountants I-IV equate to accountants II-V.)

The sounds of silence: little aid awarded for job-related hearing loss

The Environmental Protection Agency has examined a health problem that, until now, has not received much attention or financial compensation—permanent hearing loss resulting from continual exposure to noise at the workplace. The report, which looks at the compensation practices of the States and the Federal Government, claims the lack of compensation can be attributed to unrealistic medical standards for determining hearing loss, and gross inequities in the present system which leaves questions of compensation to the discretion of the States, many of which do not award compensation for hearing loss or set up prohibitive restrictions on worker eligibility and award only small sums.

According to the report, occupational hearing loss affects a surprisingly large number of workers. Results of two studies[1] show 30 percent of the workers interviewed were exposed to what they considered excessive noise on the job, and that hearing loss made up 28 percent of the probable occupational disease cases of the workers sampled. Ten percent of the workers participating in the studies had suffered some hearing loss. Thus, the report concluded it is not just a few, but a rather substantial number of workers who are potentially affected by arbitrary medical and legal criteria for compensation.

The inadequacies of current programs are partially a result of the nature of the disease itself. Noise-induced hearing loss (caused by the swelling and distortion of the nerves in the inner ear) takes place gradually over a working life; consequently, medical data are more difficult to obtain and once obtained, more difficult to analyze. An equally thorny problem is that of relating the findings of audiometric tests to everyday problems of communication. What does so esoteric a problem as impaired pure tone hearing mean for a worker's social activities, family life, and career opportunities? The elusiveness of hearing impairment has severely hampered efforts to set up a more equitable compensation system.

The medical thresholds used to measure hearing loss have been controversial since the end of the Second World War, when workers in war-related industries began to file hearing loss claims. In 1959, the American Academy of Ophthalmology and Otolaryngology established a widely accepted hearing loss formula which stated "hearing impairment should be evaluated in terms of ability to hear everyday speech under everyday conditions," everyday conditions being "the ability to hear sentences and repeat them correctly in a quiet environment." This definition made uncompensable a number of noise-induced hearing disorders such as high frequency hearing loss (which damages the ability to hear speech above background noise) and tinnitus (ringing in the ears). Most importantly, it did not consider thresholds for measuring impairment to the functions of discriminating and understanding speech. The academy formula only measured pure tone and hearing speech; and such measurements drastically understate the difficulties encountered by the hearing impaired in their daily lives, where background noise, accents, and other distractions create obstacles not found in laboratory tests. Despite these shortcomings, the 1959 formula became the medical standard of the compensation laws of a majority of the States.

As audiometrics became more sophisticated, the 1959 formula came under increasing attack, and in 1978, the academy revised the old formula to include impairments to high frequency hearing. Nevertheless, the 1959 version remains law in 18 States, and its restrictive criteria severely constrain worker eligibility for compensation benefits. Yet, according to the study even the new standard has serious weaknesses, including inadequate research of several key hearing problems (for instance, the formula makes no attempt to establish a realistic assessment of the rate of growth of hearing impairment). Environmental Protection Agency researchers recommend that both the 1959 and the 1978 academy formulas be replaced by that of the National Institute for Occupational Safety and Health which has lower thresholds, thus assessing hearing loss more realistically, and furthermore, that the upper threshold used to mark total hearing loss be lowered to reflect the point where practical hearing ability is irrevocably damaged.

Compensation barriers under State programs

Medical ambiguities are not the only obstacles a worker encounters when trying to claim hearing loss compensation. Laws and application procedures in many States have kept the number of eligible claimants low. Data on claims paid showed only nine States (with New Jersey and California heading the list) award a fairly substantial number of claims. At the other end of the spectrum, nine States with a third of all industrial workers (among them Pennsylvania, Ohio, Michigan, and Indiana) have legal restrictions that for all practical purposes make hearing loss uncompensable. The other 32 States fall somewhere in the middle with their statutory restrictions, but in reality, they compensate only a few cases. According to this breakdown, 70 percent of all the Nation's industrial workers live in States that pay few or no claims.

The most prohibitive barrier to compensation is the waiting period instituted by most States to allow for recovery of any temporary hearing loss. While otologists and compensation authorities agree that a waiting period is necessary for an accurate appraisal of hearing impairment, none recommend a period of more than 2 weeks. Most States have waiting periods of 2 to 6 months after removal from the noisy employment. Many employees die, move away, or change companies before qualifying for a claim. Also, because most hearing loss occurs during the first ten years of noise exposure, a waiting period that postpones compensation maximizes the damage done to a worker's ears.

Several States also place an excessive burden of proof on the claimant. While most compensation laws do require a claimant to demonstrate exposure to hazardous conditions, too strong a burden could defeat an otherwise justified claim. Utah, which requires a "professional" noise test showing noise levels exceeding 95 dBA, is cited as an example of a State with an oppressively strong burden of proof. Problems arise when changes in the workplace have brought about reductions in the noise level and made it impossible for the worker to show previous exposure to higher, harmful levels. To resolve these problems, the study suggests a claim be considered in light of a reasonable presumption based on a worker's career history and the testimony of the claimant's doctor, rather than compelling the worker to prove prolonged exposure to a set threshold ceiling.

The filing time limits, which give the worker a specific period in which to file his claim after his last exposure, are still another obstacle to compensation. States with more liberal compensation policies have "discovery" rules which mean statutory filing time limits do not begin until the worker has become aware of his impairment. In other States, filing limits extend from 6 months to 2 years after the date of injury (in the case of hearing impairment, some States define date of injury as the last day of employment with a particular employer). These flining limits can disqualify an otherwise eligible claimant if he is unaware of his compensation rights or the work-relatedness of his hearing loss. To assure maximum worker eligibility, the study urges that the statute of limitations for hearing loss (as well as all occupational diseases) be removed.

Federal workers fare better

The author takes a much kinder view of Federal hearing loss compensation programs. The Federal program covers all employees and blue-collar workers in Federal installations. Compensation is paid for physical impairment without consideration of loss of earnings. The Bureau of Federal Employees Compensation in the Department of Labor examines each claim and decides whether or not the claim is justified. The employing agency plays no part in the proceedings, it can only present related facts to the Bureau. In awarding compensation, the Bureau looks to see if work exposure to noise exceeds 85 dBA, and if a claimant's average hearing level falls outside normal hearing thresholds. Funding comes out of general revenue. The lack of outside scrutiny and the rising number of hearing loss claims by Federal employees have created a number of administrative problems for the Bureau, and changes in current procedures are being contemplated.

This study finds that workers are being denied adequate compensation for hearing loss as a result of unrealistic and severe medical formulas and State compensation laws, while Federal workers fare better, thanks to more realistic hearing thresholds and a nonadversary approach to compensation. Its final recommendations are made in the hope that by liberalizing compensation practices so that the true extent of occupational hearing loss is realized, steps will be taken to prevent as well as compensate it.

Occupational Hearing Loss: Workers Compensation Under State and Federal Programs prepared by Richard E. Ginnold for the Environmental Protection Agency, is available from the agency's Office of Noise Abatement and Control, Washington, D.C., 20460. ☐

Quinn and Graham L. Staines, *The 1977 Quality of Employment Survey,* (Ann Arbor, Mich., University of Michigan, Survey Research Center, 1978).

Occupational wage trends in the printing industry

Wage rates for members of printing trades unions, in cities with populations of 100,000 or more, increased by an average of 7.0 percent between July 1, 1977 and September 1, 1978, or 6.0 percent if prorated to cover a 12-month period, according to a Bureau of Labor Statistics survey. The prorated increase was the smallest in 9 years and follows 2 years of moderate gains. (See table 1.) Increases for union members averaged 4.8 percent in newspaper plants, 6.2 percent in book and job shops, and 7.3 percent in lithography shops.

Variations in average wage increases for the three printing trades studied separately reflect, in part, differences in the proportion of workers receiving increases between July 1, 1977 and September 1, 1978, 92 percent in book and job, 72 percent in newspapers, and 99 percent in lithography. For workers receiving rate increases, however, gains fell within a similar range, regardless of printing branch. Excluding the upper and lower fourths of the wage rate arrays, increases for the middle half of the workers ranged from 6.1 to 10.1 percent in book and job shops, 5.4 to 10.3 percent in newspaper plants, and 7.4 to 9.8 percent in lithography shops.

Among regions, the Pacific reported the largest average wage rate increase, 9.6 percent. The smallest regional increases were reported for New England, 5.5 percent, and the Middle Atlantic, 5.2 percent, largely reflecting the relatively small gains in Boston and New York City, the predominant cities in the two regions. For the Great Lakes, the region with the largest printing trades membership outside the Middle Atlantic states, the increase was 7.9 percent.

On September 1, 1978, union printing trades workers averaged $9.07 an hour. Day-shift rates in lithography shops averaged $10.03 an hour compared with $8.97 for those in newspaper plants ($9.23 including night-shift rates) and $8.51 for those in book and job shops.

Occupational rates in book and job shops ranged from an average of $5.90 for bindery workers to $10.51 for photoengravers. The range of average daywork rates in newspaper plants was from $8.55 for mailers to $9.84 for photoengravers. In commercial lithography shops, the average for press assistants and feeders was lowest, $8.96, while that for scanner operators was the highest, $12.13; the latter also was the highest day-shift average for the survey as a whole.

Average pay levels in the Pacific region were $9.62, in the Middle Atlantic, $9.51, and in the Great Lakes, $9.11. In contrast, they were $7.29 in the Southwest and $7.13 in the Southeast. Although less important than location, city population size also seemed to be related to wage levels. For example, on September 1, 1978, wage rates in cities of at least 1 million inhabitants averaged $9.86, about 10 percent more than the $8.97 rate in cities of 500,000 to 1 million; 14 percent more than the $8.67 rate in cities of 250,000 to 500,000; and 22 percent more than the $8.06 rate in cities of 100,000 to 250,000.

On request, the Bureau or any of its regional offices will provide listings of union wage rates and employer payments for selected employee benefit funds in each of the 66 cities studied. A more detailed bulletin, providing national, regional, and city averages, and wage trends dating back to 1907, is for sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402. ☐

Table 1. Average annual wage gains for printing trades, by year and trade branch, 1968–78

Year	Total	Book and job	Newspaper	Lithography
1968–69	6.6	6.3	6.8	7.6
1969–70	8.3	8.2	7.9	9.7
1970–71	10.2	10.5	10.2	9.5
1971–72	8.0	8.0	8.3	6.9
1972–73	6.3	7.4	5.6	5.5
1973–74	8.1	7.1	8.6	9.1
1974–75	8.5	8.8	8.2	8.4
1975–76	6.9	6.9	7.1	6.5
1976–77	6.6	7.0	6.2	6.6
1977–78[1]	6.0	6.2	4.8	7.3

[1] Increases were prorated to a 12-month period to account for the change in the survey reference month.

Communications industry record slow wage gains

During 1978, wage levels for principal telephone carriers rose 6.2 percent; for international telegraph carriers, 5.2 percent; and for the Western Union Telegraph Co., 7.0 percent, according to an annual wage survey by the Bureau of Labor Statistics. The late 1977–78 increases for telephone carriers and for Western Union were their smallest annual gains of the 1970's. Yearly increases between 1970 and 1977 averaged 10.7 percent for telephone carriers and 9.5 percent for each type of telegraph carrier.

The 1978 survey of the communications industry covered 870,100 workers of major telephone carriers and nearly 16,000 telegraph workers. Combined, they accounted for approximately nine-tenths of the almost 1 million workers in telephone and wire-telegraph communications.

In December 1978, straight-time hourly earnings of workers employed by the principal telephone carriers averaged $8.43. Employees of Bell System carriers, slightly over nine-tenths of the surveyed telephone workers, averaged 22 percent more than those of other carriers—$8.55 compared with $7.02. Individual earnings of just over four-fifths of the workers fell within a range of $3.50 to $11.50 an hour; about one-eighth earned over $11.50. Hourly earnings for the middle 50 percent of the work force ranged between $6.47 and $9.44 an hour. Some factors contributing to the wide dispersion of earnings were the numerous types of skills required by the telephone industry, differences in pay by carrier and locality, and varying lengths of employee service.

Average hourly earnings among the major occupational categories in telephone communications ranged from $12.97 for professional and semiprofessional employees to $6.26 for telephone operators at the time of the survey. Construction, installation, and maintenance employees were the largest employment group, with just over 316,000 workers; hourly earnings for these workers averaged $8.79. Some other numerically important job classifications and their hourly averages were: business office and sales employees ($8.27); building, supplies, and motor vehicle employees ($7.79), and clerical employees ($7.10).

Wage rates for the nonmessenger work force of five international telegraph carriers averaged $9.70 an hour compared with $7.84 for similiar employees of the Western Union Telegraph Company in October 1978. Messengers averaged $5.02 an hour at Western Union and $3.59 for the international carriers. At the time of the survey, hourly pay levels for construction, installation, and maintenance employees—a heavily populated group—were $8.72 at Western Union and $9.76 for the international carriers.

Annual BLS studies of communications, which cover the full spectrum of activities performed by employees in the telephone and telegraph industries, are based on data submitted to the Federal Communications Commission. The data are provided by telephone carriers subject to the full jurisdiction of the Commission and with annual operating revenues exceeding $1 million, the Western Union Telegraph Co., and five international telegraph carriers with annual revenues of more than $50,000.

A comprehensive report, *Industry Wage Survey: Communications, October–December 1978* (BLS Bulletin 2071) is available. □

The age of specialization (B.C.)

I am reminded that we are not all alike; there are diversities of natures among us which are adapted to different occupations.

Very true.

And will you have a work better done when the workman has many occupations, or when he has only one?

When he has only one.

—PLATO,
The Republic, Book II

Foreign Labor Developments

ILO meeting supported older workers, improved standards supervision

PETER ACCOLLA

The 1980 Conference of the International Labor Organization, the first major ILO gathering since the United States formally rejoined the tripartite organization,[1] dealt constructively with a number of crucial labor issues. The 66th Session, held in Geneva during June 4–25, addressed, among other topics, the needs of older workers, workplace safety and health, and the application of all ILO standards. Although discussion of political issues consumed much of its 3-week session, the conference nevertheless completed its technical work in good order and produced a comprehensive report on the observance of ILO human rights standards.

Government, employer, and worker delegates from 138 countries participated in this year's conference, including those representing the new member states of Saint Lucia, Grenada, Vietnam, Zimbabwe and Lesotho. Gerhard Weissenberg, Austria's minister for social affairs, was elected conference president.

Conference actions

A new standard on the employment of older workers was adopted unanimously. It promotes antidiscrimination laws and better working conditions for millions of older workers throughout the world. The conference also endorsed a number of proposals which, after further committee review in 1981, may lead to the adoption of new standards on collective bargaining, equality of treatment for workers with family responsibilities, and safety and health in the workplace.

The conference adopted the report submitted by the committee that supervises the implementation of ILO standards. Serious violations of human rights in Czechoslovakia were highlighted, the first time in 4 years that an Eastern bloc country has been cited by the conference as a whole for noncompliance with ILO standards. The report also criticized the human rights policies of Argentina, Guatemala, Zaire, and a number of other countries. In addition, the Committee on the Application of Conventions and Recommendations reported the adoption of new measures to improve the presentation of conclusions to the conference. Countries that achieve greater compliance will be cited, and more detailed explanation of compliance problems will be provided when available. The adoption of this new approach followed extensive debate on a Soviet bloc proposal to eliminate the so-called "special list" and "special paragraphs" used to elicit compliance with standards. Rejection of the proposal allows the ILO to continue to highlight flagrant violations of workers' human and social rights.

The conference endorsed specific recommendations for action by governments, employers, and workers and by the ILO against apartheid labor practices in the Republic of South Africa. The recommendations, proposed by the Committee on Apartheid, included a request to update the 1964 Declaration Concerning the Policy of Apartheid and to organize within 1 year an international tripartite meeting in one of the "front-line" African states to plan a joint international program of action.

A resolution criticizing Israeli settlements in Palestine and other occupied Arab territories was adopted in the first use of secret-ballot voting. Under the ILO's unique rules, abstentions are not counted towards a quorum. The resolution achieved the necessary quorum (257) for adoption in plenary when 15 delegates voted against the resolution, 249 in favor, and 156 abstained. Many states charged that the resolution violated existing due process machinery of the ILO and that it diverted the attention of the resolutions committee from consideration of issues more germane to the work of the ILO.

A resolution concerning newly independent Zimbabwe was unanimously adopted by the conference. The resolution requires the ILO to develop a program designed to address critical issues of resettlement, training, and worker education. A third resolution, also

adopted unanimously, outlines the need for a rural development program, including agrarian reform to eradicate poverty and provide adequate nutrition, full employment, and useful education under conditions of freedom of association and equal treatment.

Finally, the conference responded favorably to a number of U.S. initiatives committing the ILO to study the need for minimum international labor standards and to examine the relationship between energy and employment.

Supervising ILO standards

This year, the Committee on the Application of Conventions and Recommendations examined closely its working methods and its manner of informing the conference of its conclusions in individual cases. As before, its 1980 report highlighted the shortcomings on the part of governments in ensuring the implementation of ratified conventions or otherwise complying with their constitutional obligations. Cases of continued failure over several years to eliminate serious deficiencies were, as usual, given great attention. For the first time, however, emphasis was also given to cases of government progress in ensuring the application of conventions and recommendations. A further innovation was that the committee will now report on the nature of the difficulties which governments—particularly in developing countries—may face in the discharge of their obligations. Such explanations were provided by nine governments, while the committee noted the absence of reports or requested information in 30 cases concerning 17 countries. Direct contacts between representatives of the ILO and governments, technical cooperation, seminars, study courses, and fellowships were cited by the committee as means of assisting governments in overcoming reported difficulties.

Satisfactory progress toward standards compliance, resulting from changes made in law and practice, was noted for four countries (Gabon, Honduras, Kuwait, and the Philippines). Seven countries were reported in "special cases" paragraphs (notices of major violations); Argentina, Czechoslovakia, Guatemala, Tanzania, and Zaire were cited for severe violations of important ILO human rights conventions.

After examining member states' compliance with standards, the Committee of Experts on the Application of Standards provides an initial report outlining deficiencies. This analysis serves as the basis for discussion by the Committee on the Application of Conventions and Recommendations. Explanations given by government representatives and comments of employer and worker members in committee sessions permit a frank and constructive dialogue. These discussions are the final and most crucial phase of ILO supervision of ratified conventions. It is also the only forum in international organizations where national workers' and employers' organizations have the opportunity to question their own or another government's labor policies as they relate to specific issues or cases under discussion. This year, the committee discussed in depth a number of cases dealing with the key human rights conventions on forced labor, discrimination, and freedom of association.

Noting the constructive spirit that prevailed in the work of the Committee on the Application of Conventions and Recommendations, the conference unanimously adopted the committee's report. In addition, the conference noted changes made by countries during the past year (more than 70 cases) to comply with their international obligations.

Progress also was noted in the implementation of standards concerning migrant workers, and the conference expressed hope that a general survey made by the committee of experts would help overcome obstacles to their ratification and difficulties in their application.

Far-reaching resolutions finally emerge

This year, the Committee on Resolutions focused almost exclusively on the merits and objectives of a resolution presented by the government delegation of Jordan "deploring" Israeli settlements in Palestine and other occupied Arab territories. The resolution was one of five resolutions selected for priority consideration by the committee from a group of 17 resolutions submitted to the conference earlier.

Many committee members considered the resolution to be an extraneous political issue; nevertheless, it occupied the complete attention of the committee delegates for 2 weeks. As a result, other labor-related resolutions concerning rural aid, job training, migrant workers, and programs to eliminate child labor failed to receive adequate consideration. Representatives of governments, employers, and workers argued that the Arab charges of possible harmful impacts on employment and conditions of work in Israeli-occupied areas should be investigated through existing ILO due process procedures before a preemptory judgment was reached.

After committee approval, the resolution on Israeli settlements was further discussed in the plenary of the conference, where it was ultimately adopted by a secret-ballot vote.

A proposed resolution concerning technical and other forms of assistance for the newly created State of Zimbabwe emerged with a degree of unanimity which was in sharp contrast to the divisive atmosphere provoked by the debate on the resolution concerning Israeli settlements. Similarly, a proposed resolution providing for ILO program activities emphasizing rural development also won the endorsement of the full committee. Two other proposed resolutions selected for priority consideration dealt with the ILO contribution to the training and retraining of managers, with special reference to developing countries. Neither was considered by the committee, but both may be reintroduced in following meetings.

The fifth proposed resolution accorded priority status—but also not considered—applied to the overall issue of training, a theme treated extensively by Francis Blanchard, the Director General, in his annual report to the conference.

Technical committees

Older workers. The extensive debate in the Committee on Older Workers reflected the general desire for actions both at the national and international levels to ensure the most equitable treatment and all necessary protection for these workers. The committee recommendation, which was adopted by the conference, encourages governments to solve the unique problems of older workers through full-employment strategies and social policies that consider all population groups and ensure that employment problems are not shifted from one group to another.

The major protective labor standards emphasized in the recommendation include the following: special laws and regulations to prevent employment-related discrimination against older workers; measures which enable continuation of employment despite age; and policies that enhance preparation for and access to retirement, ensuring a gradual transition between work and voluntary retirement with a pension. Specific measures suggested to achieve these objectives include a review of mandatory retirement provisions; special benefit compensation for reduced hours of work; special benefits in cases of extended unemployment or early cessation of work in arduous or unhealthy occupations; flexible eligibility age for old-age benefits; and retirement preparation programs.

Governments are particularly urged to formulate measures in cooperation with employers and workers to prevent discrimination against older women in areas such as choice of employment, job security, pay and benefits, working conditions, and vocational training. The instrument also recommends special efforts to provide retraining for displaced older workers and assistance in securing new employment. These measures might also apply to older persons returning to the labor force following a commitment to family responsibilities.

Work organization and working time could be modified to reduce stress or excessive work pace, and the job and its content could be adopted to the older worker. These suggestions might involve part-time employment, flexible working hours, and transitional retirement programs.

The recommendation may be implemented through laws or regulations, collective agreements, or as appropriate and consistent with national practice taking into account national economic and social conditions. The instrument adds that older workers, employers, and unions should be kept informed as to rights, opportunities, and measures designed to assist older workers.

The United States fully supported the adoption of the recommendation after successfully introducing provisions that encouraged access for older workers, trade union organizations, and employers to agencies responsible for investigating complaints regarding discrimination and that suggested changes in national measures specifying a mandatory retirement age to conform with the principle of equal employment opportunity. Progressive U.S. laws in this area could be used as examples for other nations.[2]

Safety and health. Issues relating to workplace safety and health were among the most important discussed by a technical committee at the 66th Session. The ILO has considerable experience in this area with some 50 instruments adopted to date.

This year, the Committee on Safety and Health was concerned with the prevention of occupational hazards, improving the working environment, as well as ways of promoting the progressive application of new and far-reaching safety and health measures at the national level. Numerous committee delegates, while pointing to achievements made in many countries, also stressed the importance of a comprehensive instrument, a "framework of principles" to guide efforts to protect workers.

The committee adopted a draft convention together with a recommendation setting overall standards applicable to all branches of economic activity, including the public sector. The two draft instruments will be the subject of a second discussion at the 1981 conference.

The draft convention outlines broad principles for a national policy on workplace safety and health, including the responsibilities of public authorities, employers, workers, and others. The draft recommendation covers the technical areas of such a policy.

Among the responsibilities outlined for the state are the formulation, implementation, and periodic review of a coherent national policy designed to prevent accidents and injuries related to employment. Employers are expected to ensure that workplaces, machinery, equipment, and processes under their control are safe and without risks to health. Additionally, employers shall provide for measures to deal appropriately with emergencies and accidents.

Workers are expected to cooperate in the fulfillment of the obligations and responsibilities by their employers and should have the right to cease work if, in their view, there is an immediate and serious threat of injury or death. Such work stoppage must be reported immediately to the employer or the workers' safety delegate. The right to cease work on the basis of serious threat of injury or death will be discussed further next year when workers and employers will seek to define the issue more clearly, including delineation of responsibilities and conditions of work.

The draft convention also proposes the inclusion of safety, health, and working environment questions at all levels of education and training, including those of higher technical, medical, and professional institutes.

In accepting the report of the committee, the conference also decided to amend the list of occupational diseases appended to Convention No. 121 dealing with employment injury benefits. The newly revised list covers 29 diseases, 14 more than in 1964 when the convention was originally adopted.

Added to the list are hearing impairment caused by noise, disease caused by vibration and work with compressed air devices, certain skin diseases, lung cancer caused by asbestos, bronco-pulmonary diseases caused by cotton dust or flax, by hemp or dust, and by hard-metal dust, occupational asthma, diseases caused by various substances or their components (cadmium, fluorine, nitroglycerin, carbon monoxide, hydrogen cyanide, hydrogen sulfide, alcohols, cycols, and ketones), and extrinsic allergic alveolitis caused by the inhalation of organic dusts. Medical care and income maintenance are some of the benefits that ratifying countries (17 in January 1980) must provide for all listed illnesses and injuries.

Collective bargaining. A new standard to promote collective bargaining was examined in committee in the first stage of a 2-year review. The Committee on Collective Bargaining endorsed the shared decisionmaking process obtained through collective bargaining. It noted that in addition to improving the lot of workers, free bargaining also has increased productivity and permitted important economic and social changes in numerous countries. However, a number of government delegates as well as employer and worker delegates on the committee noted that the weak character of employers' and workers' organizations in some areas represented a "serious obstacle" to effective bargaining, particularly in many developing countries.

The recommendation proposed by the committee, if adopted by the 1981 conference, will emphasize not only the need for negotiation between workers and employers but will also suggest ways of making collective bargaining more effective in all levels of economic activity.

Existing ILO instruments promoting collective bargaining[3] would be reaffirmed under the proposed recommendation. Complementing the earlier standards, the proposed instrument would encourage collective bargaining in all negotiations for the purpose of determining working conditions and terms of employment and regulating labor-management relations. As suggested, bargaining should be possible at all levels, including that of the establishment, the undertaking, the branch of activity, or the regional and national levels.

The proposed recommendation cites the need for independent and representative employers' and workers' organizations, with access to appropriate training and the ability to select their own bargaining representatives. Access to information is required for meaningful negotiations, and the proposal envisions that employers would make available, within limits, information on the economic and social situation of the negotiating unit. Public authorities, likewise, should provide information regarding the economic and social situation of the country and industry concerned, without jeopardizing the national interest.

The report of the committee was adopted by the conference without objection on June 25. Prior to its adoption, however, both worker and employer representatives expressed certain reservations with respect to its content. The workers emphasized that the scope of the instrument "cannot be left to governments to determine" and indicated they would seek instead to strengthen the effect of such standards through a proposed convention in 1981. The employers, on the other hand, expressed concern that a large part of the committee's work was consumed in considering " . . . novel and far-reaching concepts for collective bargaining that are not already accepted in most developed countries . . . " In their view, it would be impossible to impose uniform collective bargaining regulations throughout the world.

Workers with family responsibilities. The Committee on Workers with Family Responsibilities examined measures which would ensure equal opportunities and equal treatment for workers—both men and women—with family responsibilities. Conditions of employment, child-care services and facilities, and social security programs were identified as areas of special concern for such workers.

Proposals for both a convention and a recommendation, to be considered for possible adoption during the 1981 conference, provide for training measures to facilitate the integration of workers into the labor force for the first time and after an absence from employment for family responsibilities. The instruments specifically provide for safeguards against job loss because of family or marital commitments.

The proposed recommendation addresses hours of work, protection of part-time and temporary workers and homeworkers, and parental leave.

Previous instruments adopted by the ILO[4] contributed to the employment of women in certain countries, but many difficulties prevent the attainment of full equality of opportunity and treatment. Obstacles cited by the committee were social attitudes, preconceived ideas as to the capabilities and aptitudes of women, their lesser access to educational and job training programs, and limited employment experience.

Noting the progress achieved by the committee with regard to employment rights and privileges of women with family responsibilities, the U.S. Government and Labor delegates supported committee efforts to balance family responsibilities with demands of the workplace.

1980 achievements reflect potential

An objective review of the 1980 conference proceedings confirms that progress was achieved in a number of significant areas. The machinery for overseeing the implementation of ILO conventions in member states was strengthened. As a consequence, efforts to promote compliance with ILO standards should be more effective, particularly in such areas as freedom of association, forced labor, and discrimination in employment.

Moreover, in supporting a sound recommendation on older workers as well as proposals of new standards in such areas as workplace safety and health, collective bargaining, and workers with family responsibilities, the conference reaffirmed the ability of the ILO to tackle serious technical issues for which it has a unique competence.

These achievements, along with the adoption of resolutions providing for training and technical assistance, demonstrate the ability of the ILO to deal with labor issues concerning member states. In the future, the attention given this work should far exceed that devoted to extraneous political issues. Although political questions are inevitably related to issues discussed by the labor conference, member states should exercise restraint so as not to lose sight of the principles and purposes of the tripartite organization. □

FOOTNOTES

[1] In November 1977, the United States withdrew from active membership in the ILO.

For a discussion of the decision to withdraw and the subsequent decision to rejoin, see Tadd Linsenmayer, "U.S. rejoins ILO: agenda for 1980's stresses human rights," *Monthly Labor Review*, May 1980, pp. 50–51.

[2] The United States is one of the few countries in the world with substantial legal protection against age discrimination in employment through the Age Discrimination in Employment Act which protects workers age 40 to 70.

[3] Current ILO standards covering the right to collective bargaining include Convention No. 98 (1949), ratified by 109 member states, and Recommendation No. 91 (1951).

Exploitation of children widespread, ILO reports

TANYA KUCHEROV

Nearly 55 million children not yet 15 years old are working in violation of the minimum age set by a 1973 International Labor Organization convention. Realistically, the number of children involved is probably even higher because they usually work illegally and along with their employers are reluctant to provide data.

This information is found in the ILO study "Children at Work," which investigates the use of child labor in 10 ILO members of Asia, Latin America, Africa, and southern Europe—none is among the 20 countries that have ratified the ILO agreement. Almost 53 million of these children are working in underdeveloped regions and 1.5 million in industrialized regions. Furthermore, the ILO suggests that in some areas the number of employed children may even be rising, but this increase could be counterbalanced by more children attending school.

Child labor in practice

Agricultural work is by far the most important sector for child labor. Argentine children, for example, are employed intensively in harvesting cotton, tobacco, mate, tea, and sugar cane, as well as growing paprika. In one province the ILO reports that 88 percent of the 10- to 13 year-olds are working on cotton plantations, and in another region 75 percent of this age group were already working on tobacco plantations. In both areas, virtually all children over age 14 were at work. Similarly, Mexican children usually begin working in agriculture at the age of 6 by sowing and harvesting crops such as cotton, tomatoes, and sugar cane. In Peru, Greece, and India, well over half the child labor force is involved in some form of agricultural work. One particular crop, the coffee bean is harvested mainly by women and their children in almost all regions of the world.

Another common form of child labor according to this study is the tradition of handing children over to families or future employers who will "adopt" or hire them as a subordinate member of the household. Young girls are usually "adopted" as domestic servants while boys are laborers or shepherd boys in return for a small loan or payment to their parents. These children then become dependent on their adopted parents who usually exercise total control over their working conditions, leaving the child vulnerable to abuse.

Thirty-seven percent of all female domestic servants

Tanya Kucherov is an international relations officer at the Bureau of International Affairs, U.S. Department of Labor.

in Peru are 14 to 19 years old. In addition, 88 percent of the domestic servants have immigrated from rural areas to the big cities such as Lima. Few of these women are members of trade unions, leaving the majority unprotected by, or ignorant of the possibility of, legal defense against abuses. Italian girls in the domestic service, however, have been replaced to a large extent by other nationalities. In Nigeria, the number of girls performing this service is also declining.

Other children may continue living at home while serving as so-called apprentices to employers or artisans for no pay. Usually these children are performing menial tasks rather than learning a job or trade that will be useful in the future. However, in some cases, when the child is working directly for an adult worker he may actually serve an apprenticeship and receive a share of the adult's earnings. This practice is common in Greece, where in certain trades such as shoemaking and tailoring a worker will hire an assistant. The Pakistani shoe industry reveals many children working alongside their parents for informal on-the-job training; this kind of apprenticeship may last from 2 to 4 years.

Commonly witnessed is the child who is forced to survive by taking to the streets, where he will peddle goods, run errands, beg, or collect junk. In some countries parents have even been known to deliberately maim their children, leaving them to beg on the streets to supplement the family income. Other outgrowths of child labor on the streets are drug-running and prostitution. City children in Peru enter street life as soon as they can leave home (around 7 years old) and can be seen working "in the markets, cinema entrances, bus and railway terminals, [parking lots], and the main squares."

In the manufacturing sector children usually work in smaller enterprises or cottage industries. Some of the most commonly performed tasks are packing, gluing, and labeling, as well as actual production-line jobs in the textile industries, tailoring and leather industries, leather and woodwork shops, pottery shops, cigarette factories, and the construction industries. In India, for example, the children are still commonly employed in the manufacturing of watches and carpet, and the processing of cashew nuts, with hours of work as long as those of adults. The Anti-Slavery Society of London has reported that over 20,000 children are employed in match factories for 16 hours a day beginning at 3 a.m. Indonesian girls, under an ostensibly voluntary arrangement, usually work in the cigarette industry from 5 a.m. until 5 p.m. with one hour for lunch.

Many children in Pakistan still work in the handwoven carpet industry, a traditional family occupation in which children with manual dexterity excel. Exploitation of child labor in Pakistan is most severe in the building industry and quarrying. According to the ILO, children are "in effect abducted from their homes and confined in camps, where they are closely watched and severely punished and humiliated if they try to escape."

In Thailand, child labor is prevalent among glass industries, cold storage services and canned food industries. Working 6 days a week, 8 to 9 hours a day, a child in the glass factory is exposed for long periods to high temperatures and inevitably suffers from the heat. In cold storage factories, with similar hours, children often have to stand on floors flooded with water used for cleaning the seafood.

Safety and health at stake

Illegal and subject to exploitation, the child labor force has little or no influence over the working environment even with its numerous safety and health hazards. A child's body is extremely vulnerable to such hazards, more so than an adult because of soft bone tissue, shorter attention span, lower resistance to disease, and less endurance under strenuous and long working hours.

According to the ILO, street children generally feel freer than children who work in other sectors, but are still exposed to harmful weather conditions, often until late at night, to traffic hazards, street diseases, and detention by the police for vagrancy. Peddlers of petrol have been known to receive entire body burns during their work; while rubbish collectors, bent from the weight of the load, often permanently damage their spinal cord growth.

Perhaps the most harmful child labor sector is agriculture, which also includes the largest number of children. Dangerous machinery and pesticides, as well as prolonged exposure to heat, sun, dust, wind, and insects (disease carriers), all contribute to a particularly unsafe and unhealthy environment.

Employment in the manufacturing industry may be equally dangerous. Not only are the hours long, but children are more prone to accidents involving machinery because of their shorter attention span. Also, they are more susceptible to the harmful effects of toxic substances such as glues which can produce paralysis, or the absorption of wool dust into the lungs which causes tuberculosis and possibly cancer. Anemia and chronic bronchitis are common among children in the cigarette industry in India.

An unbalanced diet or malnutrition only compounds the child's predicament. Lack of proteins combined with fatigue from work can seriously damage the central nervous system. In Nigeria the working child's problem is finding the time during the workday, and supply, for food. This improper diet too often results in malnutrition and contraction of the disease kwashiorkor (which causes edema, anemia, potbelly, and loss of hair). Similarly, in India 25 percent of the children working on plantations were in an advanced stage of vitamin A deficiency.

Violations of labor standards

Twenty members have ratified ILO Convention No. 138 on minimum age, but child labor is a long way from being eliminated. Convention No. 138 generally sets the minimum age for employment at 15 years and specifies that no person under age 18 should be exposed to hazardous working conditions. The corresponding Recommendation No. 146 states that young workers should enjoy equal pay for equal work, should be allowed 12 hours off at night for rest, customary weekly rest days, annual paid holidays, social security, medical care and benefit schemes, and satisfactory standards of safety and health.

However, most working children are now between 13 and 15 years old and many begin even younger. Domestic servants, for example, usually start between ages 9 and 10, whereas apprentices may begin as early as the age of 6 or 7. Depending on the sector and regional traditions, children may begin agricultural labor at very early ages; the rural child in Peru and in Mexico begins at about 6 years; children in India usually set out at the age of 8 or 9; and in Argentina at 6 or 7 years old.

Equal remuneration is clearly an anomaly, when applied to working children, who are either unpaid or receive negligible wages—about half the normal adult salary for the same work. Similarly, children's medical care and social security are rare. Also, children often conceal injuries from employers for fear of losing their job, and employers will let injuries go untreated for fear of drawing the attention of authorities to their illicit employment practices.

A good example of the lack of job security for children is given by the Anti-Slavery Society of London. In the Moroccan carpet industry, female apprentices under age 13 may work for no pay because of the skills they are learning. Once 13 years old, however, they are usually fired because Moroccan law stipulates that any worker 13 or over must be salaried as an adult.

Social and economic roots

The overriding cause of child labor, reports the ILO, is poverty. Parents who do not have the means to support the child or themselves, may have no choice but to send the child to work illegally or to have the child help them in their own work. A second contributing factor is the conflict between education and work, in terms of both availability and parental attitudes.

Economic need was seen in Nigeria as the major cause for urban child labor. Urbanization and modernization have tempted rural families with prospects for better jobs, causing a great influx of rural dwellers to the cities. When faced with the problem of paying for food and shelter, however, these families are forced to send their children to work.

In addition to economic need, the traditional attitudes of parents toward work, as opposed to education, may encourage the child to seek work rather than pursue an education. In some cases there may not even be a choice between work and school because of the severe shortage of educational facilities in rural areas. But the ILO suggests that usually where such a choice exists, the parents' traditional objections to education may cause the child to drop out at an early age or to not attend school at all.

A survey among children in Bangkok, for example, showed that the main reasons for working were: poverty; need to assist parents in household economic activity; parents want them to work; need to earn their own living; and better than doing nothing. In Italy where access to education is much better but the number of children working is high, the reasons given were: little desire to study; prefer to work; slow progress at school; illness; difficult family situation; and poor relationship with teachers.

Striving for improvement

The ILO's program for future action on child labor sets forth both short- and long-term goals. In the short term, efforts must be made to improve the working conditions of children, while the long-term goal is to eliminate child labor. To meet these goals the ILO recommends the following:

- launch a major information campaign on the physical and mental needs of children and the detrimental affects of arduous work
- better enforcement of existing legislation
- extension of compulsory schooling to all children
- encouraging trade unions to fight for the eradication of child labor, and thus for increased employment opportunities and higher wages for adults

It is interesting that the latter recommendation has been successfully tried in one country. According to the ILO some Pakistan trade unions proposed in 1969 that children be paid the same rate as adults for the same work in textile industries; since then the number of children employed in the textile industry in Karachi has dropped significantly.

Whatever measures are taken against child labor, ending it will involve modifying the economic and social organization and traditional attitudes of the societies concerned—which will require worldwide efforts and cooperation. □

Significant Decisions In Labor Cases

Innovative work preservation

Technological innovation increases worker productivity, thus usually reducing the number of workers required for specific jobs. At the docks, for example, the introduction of large containers offered great economic advantage to the shipping industry but threatened the jobs of longshoremen by dramatically increasing their productivity. To mitigate the full impact of this innovation on longshore employment, the International Longshoremen's Association negotiated an agreement with the shipping industry to pack and unpack only certain types of containers crossing the piers in New York, Baltimore, and Hampton Roads. According to the agreement, longshoremen would pack and unpack goods from containers that would otherwise be handled by non-ILA workers within 50 miles of the pier. As a result, 80 percent of the containers typically pass through the piers intact, while the remaining 20 percent are packed or unpacked despite any duplication of work done by non-ILA members away from the pier. Violations of the agreement called for fines imposed on the shipping companies.

Under the National Labor Relations Act, unions may enter into labor contracts that preserve work traditionally done by their members. But such agreements must be carefully constructed: not only must the work be traditionally part of the union members' work, but the contracting employer must have the power to give the employees such work.[1] When the ILA's container-handling agreements were challenged by non-ILA cargo handlers and transporters, the National Labor Relations Board ruled that the agreements did not attempt to preserve traditional longshoring work but illegally sought to obtain work traditionally performed by others. The Board reasoned that the packing and unpacking of containers away from the pier had never been performed by longshoremen. Rather, such work had always been done by employees of transportation or consolidation companies.

The Federal appeals court for the District of Columbia refused to enforce the Board's decision because it felt that the Board had incorrectly examined the nature of the work involved.[2] The Supreme Court agreed,[3] resolving a conflict among the Circuit courts.[4]

Writing for a 5-4 majority, Justice Thurgood Marshall found that container technology replaced the entire method of handling goods between ocean and motor transportation and was therefore unlike technologies at issue in earlier work preservation cases. In the past, unions completely rejected innovations that would have altered their work procedures, so that courts applied the law to circumstances where the "traditional work" could be easily and narrowly defined. But Marshall reasoned that Congress intended the work preservation doctrine to be more flexible: the law also must protect union actions that "attempt to accommodate change while preserving as much of their traditional work patterns as possible." After clarifying the scope of permissible work preservation, Marshall examined the basis for the Board's application of the law to the container-handling rules:

> The Board's approach reflects a fundamental misconception of the work preservation doctrine as it has been applied in our previous cases. Identification of the work at issue in a complex case of technological displacement requires a careful analysis of the traditional work patterns that the parties are allegedly seeking to preserve, and of how the agreement seeks to accomplish that result under the changed circumstances created by the technological advance.
>
> . . . [T]o determine whether an agreement seeks no more than to preserve the work of bargaining unit members, the Board must focus on the work of the bargaining unit employees, not on the work of other employees who may be doing the same or similar work, and examine the relationship between the work as it existed before the innovation and as the agreement proposes to preserve it.
>
> The Board, by contrast, focused on the work done by the employees of . . . the truckers and consolidators after the introduction of containerized shipping. It found that work similar to work those employees had done before the innovation and concluded that ILA was trying to acquire the traditional work of those employees . . . .
>
> By focusing on the work as performed after the innovation took place, by the employees who allegedly have displaced the longshoremen's work, the Board foreclosed—by definition—any possibility that the longshoremen could negotiate an agreement to permit them to continue to play any part in the loading or unloading of containerized cargo. For the very reason the rules were negotiated was that longshoremen do not perform that work away from the pier, and never have. Thus, it is apparent that under the Board's approach, in the words of the Court of Appeals, the 'work preservation doctrine is sapped of all life.'

"Significant Decisions in Labor Cases" is written by Gregory J. Mounts of the *Monthly Labor Review* staff.

The Board must now reconsider whether the ILA contract preserves traditional longshoring work—or its functional equivalent; if so, it must determine whether the shipping companies have the right to control the packing and unpacking of containers. Despite the Court's claim that both questions remain unresolved, the Board's decision on the agreement's work preservation objective could be constrained by the Court's characterization of the rules as "a thoroughly bargained and apparently reasonable accommodation to technological change." The Court also required the Board to consider the congressional preference for collectively bargained solutions to such disputes. The "right to control" test, however, presents far more difficult questions involving possible government regulatory constraints and the ability of shipping companies to enforce the contract rules after containers have been released to motor carriers. The Court suggested that the shippers' right to control work on containers they own or lease and in their "possession and control" might be the most appropriate focus for the Board's analysis of this issue.

Chief Justice Warren Burger wrote in dissent that the Board had correctly found that the work at issue has been traditionally performed by inland workers. Joined by Justices Potter Stewart, William Rehnquist, and John Paul Stevens, Burger charged that the ILA container-handling rules represented classic "featherbedding" and that the Court's action excessively widened the work preservation doctrine.

Secondary picketing of products limited

On the same day it clarified the scope of the work preservation doctrine, the Supreme Court also resolved a conflict between Circuit courts on the dimensions of permissible secondary boycotts under the National Labor Relations Act. The standard established by the Court's 1964 *Tree Fruits* ruling[5] permitted secondary picketing against a struck product (apples in a retail food store). In its recent decision in *NLRB v. Retail Store Employees*,[6] however, a 6–3 Court majority agreed with the Board that unions cannot follow a struck product to a secondary location and picket a neutral employer if the product accounts for substantially all of that employer's business.

In this case, the primary employer, Safeco Title Insurance Co., underwrites real estate title insurance in Washington State. Five local title companies, partially owned by Safeco, sell Safeco insurance; revenues from these sales make up more than 90 percent of the companies' gross income. At an impasse in contract talks with Safeco, the retail employees union picketed the five title companies and asked consumers to cancel existing policies. On charges filed by Safeco and one of the companies, the National Labor Relations Board ruled that the union had violated the prohibition against secondary boycotts. Even though the union had directed its efforts against Safeco insurance policies, the Board found that because the product represented nearly all of the firms' business, the union's action was "reasonably calculated to induce customers not to patronize the neutral parties at all." The appeals court for the District of Columbia refused to enforce a Board order against the union, reasoning that *Tree Fruits* permitted such picketing despite the relationship of the product to the secondary employer's revenues.

Writing for the Supreme Court, Justice Lewis Powell found that the economic impact of a union's primary-product picketing on a neutral employer is the critical factor in deciding whether such activity is lawful.

> . . . Product picketing that reasonably can be expected to threaten neutral parties with ruin or substantial loss simply does not square with the language or the purpose of [the NLRA's limitation on secondary boycotts]. Since successful secondary picketing would put the title companies to a choice between their survival and the severance of their ties with Safeco, the picketing plainly violates the statutory ban on the coercion of neutrals with the object of 'forcing or requiring them to cease . . . dealing in the primary product . . . or to cease doing business with' the primary employer.

Only four Justices could agree on the First Amendment implications of the decision. The Chief Justice and Justices Potter Stewart and William Rehnquist joined Powell in reasoning that Congress may prohibit, within the bounds of the First Amendment, specified secondary picketing that "spreads labor discord by coercing a neutral party to join the fray." Justices Blackmun and Stevens refused to take such a simple view of the constitutional issue; both wrote separate opinions troubled by the Powell's content-based ban on picketing. However, both agreed that barring the union's secondary picketing in this case was constitutionally permissible.

Justice William Brennan, joined by Justices Byron White and Thurgood Marshall, argued in dissent that the NLRA's prohibition against the coercion of secondary employers to join union interests should not be based on that employer's potential economic loss. Rather, the legality of secondary picketing, as established in *Tree Fruits*, should be based only on the union's focus on the primary product.

> . . . *Tree Fruits* expressly rejected the notion that the coerciveness of picketing should depend on the extent of loss suffered by the secondary firm through diminished purchases of the primary product. Nevertheless, the Court has now apparently abandoned the *Tree Fruits* approach, choosing instead to identify coerciveness with the percentage of the secondary firm's business made up by the primary product.

Brennan also charged that the Court's new standard would create great uncertainty among unions and the lower courts as to when secondary picketing is permissible.

> By shifting its focus from the nature of the product boycotted to the composition of the secondary firm's business, today's decision substitutes a confusing and unsteady standard for *Tree Fruits'* clear approach to secondary site picketing. Labor unions will no longer be able to assure that their secondary site picketing is lawful by restricting advocacy of a boycott to the primary product, as ordained by *Tree Fruits.* Instead, picketers will be compelled to guess whether the primary product makes up a sufficient proportion of the retailer's business to trigger the displeasure of the courts or the Labor Relations Board. Indeed, the Court's general disapproval of '[p]roduct picketing that reasonably can be expected to threaten neutral parties with ruin or substantial loss. . . .' leaves one wondering whether unions will also have to inspect balance sheets to determine whether the primary product they wish to picket is too profitable for the secondary firm.

Veterans' service added to SUB formula

Veterans whose employment is interrupted by their military service are entitled to seniority benefits calculated as if they had been continuously employed. The Supreme Court has ruled that such seniority benefits include severance pay[7] and pension benefits[8] but not vacation benefits.[9] Recently, a unanimous Court ruled that union-negotiated supplemental unemployment benefits also are perquisites of seniority and military service must be included in the determination of SUB payments. (*Coffey v. Republic Steel Corp.*[10])

In its 1977 *Alabama Power* ruling,[11] the Court included pension benefits as seniority perquisites and established a two-pronged test for determining the benefits of seniority that Congress sought to preserve for returning veterans under the Vietnam Era Veterans' Readjustment Assistance Act of 1974. First, there must be a reasonable certainty that the benefit would have accrued if the employee had not gone into the military service. Second, the nature of the benefit must be "a reward for length of service," rather than a form of "short-term compensation for services rendered."

Writing for the Court, Justice Thurgood Marshall analyzed the steel industry's SUB plan under the *Alabama Power* criteria. A steel industry employee accrues a one-half SUB credit for each week in which he worked any hours, or was paid for any hours not worked, or lost any hours because he was disabled or was performing certain union duties. To receive any SUB payments, an employee must have completed 2 years continuous service. Marshall concluded that Thomas Coffey, a Republic Steel employee laid off after a period of nearly 3 years (including 2 years of military service), would have accumulated the maximum 52 SUB credits if he had been continuously employed by Republic. Turning to the nature of supplemental unemployment benefits, Marshall concluded that they are not "a form of deferred short-term compensation, but are a reward for length of service closely analogous to traditional forms of seniority."

Marshall traced the origin of the SUB plan concept as an alternative to the unmet demand by organized labor for a guaranteed annual wage.

> . . . From the beginning . . . the purpose of SUB plans was to provide employment security regardless of the hours worked rather than to afford additional compensation for work actually performed. From the employer's standpoint, SUBs, like pension benefits, help to assure a stable work force through periods of short-term layoffs and, like severance payments, may increase management flexibility in implementing technological advances.
>
> The essential function of SUB plans is to provide economic security for regular employees in the event that they are laid off. Protection against layoff is, of course, one of the traditional attributes of seniority. SUB payments provide a second-level protection against layoff. If an employee does not have sufficient seniority to avoid being laid off, he may still have achieved the minimum level of seniority necessary to receive SUB payments during his layoff.

Although steel industry SUB payments are partly based on hours worked, Marshall emphasized that the nature of the benefits rather than the formula used to calculate them is the "crucial factor." The 2-year work requirement for benefit eligibility is a "significant period of service" for which laid-off employees are rewarded, and the fact that benefits do not continue to increase as seniority increases is unimportant, he concluded. ☐

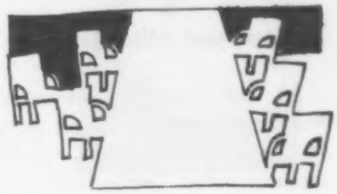
Developments in Industrial Relations



Pattern contract in copper industry

The first break in a 2-month strike against 10 major copper companies in 9 States occurred when the Steelworkers and 12 other unions settled with Kennecott Corp. Overall, the bargaining involved 40,000 workers and 23 unions. The strike began when contracts expired on June 30 and July 31.

A Steelworkers' official called the wage and benefit improvements of the copper agreement "somewhere between the package won by the union in steel and what was achieved in negotiations with aluminum, the costlier of the two agreements." (See *Monthly Labor Review*, August 1980, pp. 49–50 and June 1980, pp. 55–56.)

The major variation in the Steelworkers settlements in the three industries appeared to be in the wage escalator provisions. At Kennecott, the workers received the quarterly adjustment that was due under the prior contract, and the new contract provided for continuation of the quarterly escalator formula at the rate of 1 cent an hour for each 0.3-point movement in the Consumer Price Index for Urban Wage Earners and Clerical Workers (1967 = 100). This settlement also provided for an immediate lump-sum payment of $25 to each worker, a result of a "calculation change." In the steel settlement, the 1-cent-for-0.3-point formula was retained, but the last adjustment under the prior contract was used to help meet the cost of pension improvements. In aluminum, the employees received the last cost-of-living increase under the prior contract, and the formula in the new agreement was liberalized, providing for 1-cent adjustments for each 0.26-point movement in the index, beginning in the third year.

The "set" wage rises at Kennecott included 25-cent-an-hour general increases, plus a half-cent increase in the increment between each of the job grades, effective immediately; a 20-cent increase plus a half-cent increment increase on the first anniversary; and a 15-cent increase plus a 1-cent increment increase on the second anniversary. The afternoon, evening, and night shift premiums were increased to 30, 37.5, and 45 cents an hour, from 20, 25, and 30 cents.

Pensions for current retirees were increased by $33 to $70 a month, in steps, over the term of the agreement. For future retirees, the benefit rates were increased, in steps, up to a total of $4 a month for each year of credited service. This will bring the pension rate to a maximum of $20 for employees in the top pay grades.

Sickness and accident benefits were increased by a total of $25, bringing the average benefit to $194 a week in 1983. There also were improvements in hospital, medical, surgical, and dental insurance, and a vision care plan was established.

Teamsters unwilling to reopen contract

After brief, informal discussions, the Teamsters turned down the trucking industry's request for a reopening of their labor contract. Trucking Management, Inc., the companies' major bargaining arm, contended that a reopening of negotiations was necessary to obtain labor cost concessions from union members to permit the carriers to compete with nonunion firms. The firms were particularly interested in eliminating or delaying automatic cost-of-living increases scheduled for October of 1980 and 1981, lowering some wage scales, and changing work rules that would result in the loss of jobs. The companies contended that much of their problems stemmed from the Motor Carrier Act of 1980, which deregulated the industry, making it difficult to pass along labor cost increases through shipping prices.

The union rejected the request for negotiations because of "insufficient proof that there has been injury to the companies caused by conditions of the contract." However, the union indicated that its study of the impact of deregulation and current recession on the industry could lead to further discussions on reopening the agreement. According to an official, one eventual result could be that regional units would be advised to negotiate wage and work rules concessions for locals in depressed areas. Reportedly, about 60,000 of the 300,000 Teamsters in the industry are on layoff.

Some concessions were already being granted in a few areas. For example, locals in Omaha, Neb., and Louisville, Ky., adopted a 7-day workweek. This means that normal schedules include weekend work at straight-time pay rates. Management officials said this move would also save money for shippers because freight could be moved faster and storage costs reduced.

"Developments in Industrial Relations" is prepared by George Ruben and other members of the staff of the Division of Trends in Employee Compensation, Bureau of Labor Statistics, and is largely based on information from secondary sources.

Molders and Allied Workers resume merger talks

At the Molders convention, President Carl W. Studenrolt announced that merger talks with the Allied Industrial Workers will probably resume in several months. Allied Industrial Workers President Dominic D'Ambrosio, a guest speaker, also called for a resumption of the talks.

In other business, the union's executive board was reduced to 13 members by merging the elected editor's position into the president's position and by combining the secretary's and treasurer's positions. Also, monthly dues were raised to $12 (from $10.50) in January 1981 and to the equivalent of 2 hours of work (average of $13–$15) in 1982.

Firefighters elect new president in close vote

The biennial convention of the Fire Fighters union elected John A. Gannon, age 56, as its president. He succeeds William H. McClennan, who retired after six 2-year terms. Gannon, who had been vice president of the union for 6 years, defeated incumbent secretary-treasurer Frank Palumbo by a vote of 73,668 to 73,448, with each of the 1,400 delegates given a vote proportional to the number of members in their local union.

McClennan, who had served as a vice president from New England for 20 years prior to ascending to the leadership of the 180,000-member union, was unanimously named president emeritus.

Pregnancy discrimination suits settled

A recent settlement ended a 1974 suit which alleged that Westinghouse Electric Corp. violated the Civil Rights Act of 1964 by discriminating against pregnant employees. The suit was filed by the International Union of Electrical Workers, two of its locals, and 22 IUE members. It claimed that Westinghouse did not credit seniority to employees when they were on maternity leave; denied certain health benefits to pregnant employees; and forced them to take unpaid maternity leave after a certain time, regardless of the employee's desire and physical capacity to work.

The Pregnancy Discrimination Act of 1978 prohibits pregnancy-related discrimination; this settlement corrected certain previous practices found to be discriminatory. Provisions included a total of $305,000 in payments to women who suffered pay losses from 1971 to 1978; seniority credit for absences for reasons related to pregnancy since the July 1, 1965, effective date of the equal employment opportunity provisions of the Civil Rights Act; and specific assurances of equal treatment for pregnant women. Also involved in the suit was the White-Westinghouse Corp., which purchased five Westinghouse appliance plants in 1975 and the Equal Employment Opportunity Commission, which joined the union side in 1978 after passage of the Pregnancy Discrimination Act.

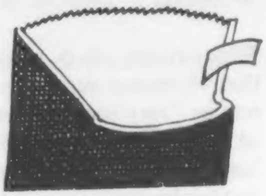
In another suit, the Fourth U.S. Circuit Court of Appeals in Richmond, Va., agreed with a U.S. District Judge that Eastern Airlines could not ground flight attendants during the first 13 weeks of pregnancy. However, three of the nine judges dissented, contending that even during the first 13 weeks of pregnancy, attendants are subject to physical problems that could hinder their ability in emergencies. In another aspect of the ruling, five of the judges held that only the carrier should determine if attendants could work during the 13th through 20th weeks of pregnancy. This overturned the decision of U.S. District Judge Robert R. Merhige, Jr., who had ruled that pregnant attendants could work during these weeks, with their doctor's permission. The appeals court unanimously concurred with Merhige that Eastern could ground attendants after the 20th week of pregnancy and that the company could not strip attendants of their seniority after they are transferred to ground duty because of pregnancy.

Eastern indicated that it was satisfied with the decision. There was no immediate comment from the Transport Workers Union, which represents the attendants and which had initiated the suit.

Work-sharing urged by job bias panel

In a move to minimize the effect of the current recession on women and minorities, the Equal Employment Opportunity Commission asked employers to consider "work sharing" and other alternatives to layoffs. The Commission said this was necessary to protect women and members of minority groups from layoff under the prevailing "last-hired, first-fired" system, which is "beginning to eradicate" the recent gains in employment they have achieved. The Commission also suggested that layoffs be based on plantwide seniority, rather than departmental seniority, saying this may reduce the adverse impact on minorities and women.

In another development involving equal employment opportunity, United States Steel Corp. agreed to hire women for 25 percent of job openings over a 2-year period at its coal mine No. 20 near Thacker, W. Va. The company's settlement with the West Virginia Human Rights Commission resolved a complaint by three women that U.S. Steel had refused to hire them because of their sex. The settlement provided that each of the three women will receive $20,000. However, the hiring of women will not begin until all employees currently on layoff at the mine are recalled. □



Book Reviews

Job creation program for researchers

CETA: Assessment of Public Service Employment Programs. By William Mirengoff, Lester Rindler, Harry Greenspan, Scott Seablom. Washington, National Academy of Sciences, National Research Council, Committee on Evaluation of Employment and Training Programs, 1980. 197 pp.

Involving Private Employers in CETA Programs. By Leonard A. Lecht and Marc A. Matland. New York, The Conference Board, 1979. 18 pp. (Information Bulletin 63.)

Areawide Planning in CETA. By Randall B. Ripley, Donald Baumer, and Carl Van Horn. Washington, U.S. Department of Labor, Employment and Training Administration, 1979, 128 pp. (R&D Monograph, 74.) Stock No. 029-000-00388-4. $4.50, Superintendent of Documents, Washington 20402.

Each year, the Employment and Training Administration provides hundreds of thousands of dollars for research on manpower programs. To persons in consulting firms and universities involved in the research, there is a real sense of professionalism in the work. The researchers usually visit a number of program sites, talk with program officials and local businessmen, collect data, and write reports, including recommendations for program improvement.

However, to persons outside the research world, the reports often are of little value. The site visits, interviews, and data collection usually only capture the program surfaces, and further, only those surfaces that the program operators want to be seen. The recommendations usually are statements of the obvious, or excessive praise for the programs, or highly impractical (or misdirected) schemes.

In the following review, I'd like to discuss three recent reports which illustrate these criticisms.

CETA: Assessment of Public Service Employment Programs is the most recent in a series of works on CETA by the National Research Council. Its authors, William Mirengoff, Lester Rindler, Harry Greenspan, and Scott Seablom, focus on the public service employment component of CETA.

Established in 1973 as an appendage of the main training programs, public service employment was increased sharply as a measure to combat unemployment during the recession of the 1970's, and had up to 725,000 workers by 1978. In 1978, it was cut, but still had over 400,000 workers by the end of 1979.

Public service employment had many reasons to be successful: it promised work rather than welfare, it promised to move participants steadily into permanent jobs, and it promised to accomplish socially-valuable work. But it has not come off as was hoped and has encountered criticism from many quarters. Unions have complained that public service jobs have been used to substitute for regularly funded jobs. Community groups have complained that jobs have not gone to the lower-skilled and less-directed among the unemployed. Newspapers have complained about the make-work nature of the jobs. Nearly everyone has complained that participants have not moved into unsubsidized jobs.

Mirengoff and his coauthors considered these complaints. They collected information (through field associates) from 28 programs throughout the country. There is much of value in the report. For example, the authors point out some of the reasons why even with the greater targeting brought by the amendments of 1976, the "structurally unemployed" have not been hired in proportion to their numbers among the eligible unemployed. They also point out that the 1976 amendments have not fully succeeded in preventing the use of public service employment jobs in the place of regularly funded jobs.

However, the report also suffers in many sections from its reliance on field associates and interviews and data collection, and distance from the subtleties and complexities of local operations. For example, commenting on the work done by participants, the authors state firmly that "as the law required, projects did provide public services that were useful," that were not make-work; and further that "project enrollees were found to perform their duties as well as regular employees in similar positions."

But there is little focus on local programs to convince readers that this is so, or give readers a feel for the actual accomplishments of public service employment.

What we do get is a survey of local officials showing that 95 percent support public service employment projects as "very useful," not surprising given that at least 95 percent of local officials prefer Federal to local funding of services; and the view of most field associates that make-work was "negligible." It would have been more useful to have a more detailed picture of a few programs, a connecting of the statistics with the tasks performed and the faces behind the statistics. Further, we get no feel for the personnel problems connected with public service employment. In the programs I've observed, public service employment has performed many valuable tasks, but also has been limited in effectiveness by the resentment and hostility of some regular employees.

On the transition of these workers into unsubsidized employment, the authors urge that public service employment projects "combine training with public service jobs that furnish marketable skills and experience" and that "greater stress should be placed on transition of public service employment enrollees to unsubsidized jobs."

But there is little discussion of the practical tradeoffs connected with this recommendation: tradeoffs between training and other goals of hiring the structurally unemployed and of performing useful work. To illustrate: jobs such as child-care worker, librarian, or dance instructor may have considerable social value, but have little demand in the private sector. By contrast, clerical jobs which are in demand in the private sector, may contribute less to public service.

In *Involving Private Employers in CETA Programs*, Leonard A. Lecht and Marc A. Matland examine strategies for increasing participation of private sector employers in local CETA programs. Again, the subject is interesting and important. Training by private employers consistently has been the most successful. Yet, only a small proportion of employers in any city gets involved.

In order to find out reasons for the low participation (and what might be done to increase participation), the authors survey nine programs across the Nation. They spend time at each site interviewing CETA staff, planning council members, and employers—in all an impressive total of 275 interviews.

They begin the report by identifying four factors as influencing business participation: "community socioeconomic environment," "CETA enrollee characteristics," "prime sponsor-employer linkages," and "prime sponsor's organization and program orientation." Of these, they describe the latter two as most important and go on to note recommendations for greater business involvement. These include representation of business on planning councils, ties with the National Alliance of Businessmen and the local chamber of commerce, understanding by program staff of the needs of local business, less paperwork, and greater use of tax credits rather than subsidies.

How valuable are these recommendations?

Most are well-known to local officials. A personal recollection: my first job in the manpower field was with the CETA program in Alameda County, Calif. Soon after I began working, I approached the program director and suggested that our program look into ways that additional businesses could be brought into the program. The director took out paper and wrote a list of the reasons for limited business involvement. They included nearly all of the findings of this report.

The director also spoke of the general strategies for business involvement. What might have been of value to him and other local officials were specific studies of programs that did and did not succeed with businesses. But such studies require more than merely conducting interviews with local officials or even with employers.

Further, the limited detail which the authors bring to their recommendations indicates little recognition of the practicalities of local operations. One example is the authors' suggestion that program officials be required to include in their annual plans detailed information about business involvement. The authors state that the plan should indicate "placements in unsubsidized employment by class of employer; placements in private for profit firms for individual programs such as on-the-job training; makeup of the council membership; and linkages with the local business community."

This sounds good in theory, but from a local perspective, annual plans take up considerable time, do not appear to me to be read seriously by Department of Labor officials, and rarely spark reflection among local planning staffs who generally put together the required information as a "going through the motions."

Another of the authors' suggestions is that additional funds be spent for public relations. Again this sounds good in theory, as there is limited understanding of CETA by businesses and the general public. However, in practice the money spent by local programs on public relations has not, in my opinion, been well spent. It has been spent on films and pamphlets (such as *CETA Works* by the National Association of Counties) that have been uncritical whitewashes which convince no one.

The third and poorest of the reports is *Areawide Planning in CETA* prepared by Randall B. Ripley, Donald Baumer, and Carl Van Horn. Again, we have a study based on site visits. The authors visited 12 sites around the country, selected "because they were reputed to take planning seriously."

The authors then test the models against a number of performance indicators (positive terminations, cost per placement) to come to the wholly predictable conclusion that the "future-oriented" programs perform best, followed by the "operations management," and then the "crises management" programs. The authors conclude that programs work well that have key staff of the highest quality who are encouraged to remain with the program, a monitoring system that yields accurate and complete information, control of service deliverer participation in key decisions which affect who the program services, involvement of the business community in more than token activities, and political officials who support decisions made by staff. More of the obvious.

The authors begin by setting three models of planning: a *crises management* model characterized by "unstable relations among actors," "unmanaged conflict," "lack of routing," and "malfunctioning feedback system"; an *operations management* model characterized by "stable relations among actors," "well-managed conflict," "many routine procedures," and "feedback mechanism in place and utilized"; and the *future-oriented* model, characterized by the four characteristics of the "operations management" model as well as by "deliberate attention to long-range decisions."

Of the 12 programs surveyed, only one is categorized as "crises management." Eight are "operations management" and three are "future-oriented."

But do these models have practical value?

The authors first test them against a number of local labor market and economic growth characteristics, and against characteristics of the size and structure of programs. They come to the predictable conclusion that none of the factors determines the type of planning operation, that a good planning operation can exist in a program of any size or structure or local economy.

Other conclusions are embarrassingly uncritical. The authors praise a number of programs, which would be better served by a more balanced, harder look. For example, the authors praise the evaluation system of a large program in the East, which traces participants for 6 months or more. In fact, the system is of little value. Its reports tell little more than that a participant is working or not working. These reports do not go beyond the statistics, do not probe into why the training might have been sufficient or insufficient, or why some participants decided to return to the netherworld of welfare and hustle.

Uncriticalness, generality, distance from programs, especially from participants, characterize not only the three reports considered here, but also most research reports today. The persons who put together these reports usually are bright, with fine educational backgrounds. However, their evaluation of site visits, interviews, and reliance on statistical data usually yields little of value to national or local officials.

What is needed is for these researchers to get out of their offices; to spend months, not days, studying local programs; and most of all to be far more questioning of the claims of program officials.

Big is beautiful

World Economic Development: 1979 and Beyond. By Herman Kahn. Boulder, Colo., Westview Press, 1979, 510 pp.

In distinct contrast to what is rapidly appearing to be the mainstream of the literature on development, Herman Kahn argues that policies promoting high economic growth in a basically market-economy are physically practicable, socially desirable, and perhaps even morally necessary. To make this argument, Kahn faces off against ideas that are currently enjoying great power in the imaginations of the scholarly, opinionmaking, and policymaking elites of the advanced, market-oriented countries. Among these ideas are the (physical) limits-to-growth school, the small-is-beautiful movement, the concern for protection of an ecology at almost any economic cost, the approach of something close to a "health and safety authoritarianism," and increasing favor for social control and overall planning of the economy.

All of these ideas, and more, are parts of, or extensions of, what Kahn has termed the "Fourteen New Emphases" in the socioeconomic and political cultures of the advanced industrial nations in general, and their upper-middle and intellectual classes in particular. His development and elaboration of these emphases in the third chapter is the keynote of his section on "Framework, Concepts, Perspectives." This section is the more provocative in the book, the second bogging itself down in case study and admitted progrowth polemic and proselytism. The whole spirit, however, is one of vigorous and open opposition to what Kahn feels is an unfair and unwise overpublicization of the antigrowth position.

World Economic Development is an exercise in macrohistory and futurology that can (perhaps should) be taken with a grain of salt, or what its author would call the "agnostic use of information and concepts." I did, however, find it refreshing to read an optimistic scenario of the long-run economic future.

The service sector in perspective

Understanding the Service Economy: Employment, Productivity, Location. By Thomas M. Stanback, Jr. Baltimore, The Johns Hopkins University Press, 1979. 122 pp. $9.50.

This concise and enlightening book analyzes several aspects of the service sector of our economy: the demand for services, productivity in services, and the nature and location of service employment. Thomas M. Stanback defines "services" to include wholesale and retail trade, government, finance, insurance, and real estate, and professional, personal, business and repair services; he excludes the capital-intensive transportation, communication, and public utility industries.

Stanback begins by refuting the common belief that consumption in the United States is rapidly becoming more service-oriented. He shows that consumption of services did increase faster than disposable income during the 1950's, but that from 1960 to 1977 the portion of consumption expenditures (adjusted for price changes) devoted to services increased only from 42 to 45 percent. As a brake on the growth of service consumption relative to that of goods, Stanback cites the high degree of "complementarity" between many goods and services. For example, the increased use of the automobile generates an increased demand for maintenance services, and the increased demand for recreation services raises the demand for goods such as skis and tennis rackets.

Stanback notes that productivity gains in services have not matched those in nonservices. However, he cites several factors—such as the application of new managerial approaches to service firms, and the use of computerized checkout systems in retailing—that may herald significant productivity advances in services.

In his analysis of service employment, Stanback shows that compared to nonservices, service work is characterized by lower earnings, higher proportions of women, minority, and part-time workers, and fewer institutional arrangements to enhance job security. Probably the most useful part of the book is the analysis of the location of service employment. The author shows that while the location of jobs in consumer services is related to that of population, jobs in business services are more concentrated geographically. Stanback, the coauthor of two previous books on urban economics, presents many interesting findings, such as: metropolitan areas that were centers of business services in 1960 experienced the greatest growth in business services during the following decade, while areas that were manufacturing centers in 1960 made little progress during the following decade in attracting business service employment.

Stanback concludes with a discussion of the spatial labor market adjustments required for future service employment growth. Under conditions of rapid growth in aggregate demand, "Employment levels remain relatively high in areas least favored, while in areas where shortages develop demand is met by upgrading, by migration, and by utilizing personnel who might otherwise have left or never entered the labor market." However, if aggregate demand grows slowly, labor market maladjustments will result that "are likely to take their toll disproportionately on those who are least skilled, least experienced, and least able to make difficult adjustments through migration. . . ." Citing the slow growth of the economy in recent years, Stanback promises little immediate relief for these sufferers of migration headaches.

By combining skillful data analysis and penetrating observations on the nature of the service sector, Stanback has produced a readable and incisive book that will be of great value to economists and noneconomists alike.

25. Consumer Price Index, selected areas 88
26. Producer Price Indexes, by stage of processing 89
27. Producer Price Indexes, by commodity groupings 90
28. Producer Price Indexes, for special commodity groupings 92
29. Producer Price Indexes, by durability of product 92
30. Producer Price Indexes for the output of selected SIC industries 92

Productivity data. Definitions and notes 95
31. Annual indexes of productivity, hourly compensation, unit costs, and prices, 1950–79 95
32. Annual changes in productivity, hourly compensation, unit costs, and prices, 1969–79 96
33. Quarterly indexes of productivity, hourly compensation, unit costs, and prices, seasonally adjusted 96
34. Percent change from preceding quarter and year in productivity, hourly compensation, unit costs, and prices 97

Labor-management data. Definitions and notes 98
35. Wage and benefit settlements in major collective bargaining units, 1975 to date 98
36. Effective wage rate adjustments going into effect in major collective bargaining units, 1975 to date 99
37. Work stoppages, 1947 to date 99

NOTES ON CURRENT LABOR STATISTICS

This section of the *Review* presents the principal statistical series collected and calculated by the Bureau of Labor Statistics. A brief introduction to each group of tables provides definitions, notes on the data, sources, and other material usually found in footnotes.

Readers who need additional information are invited to consult the BLS regional offices listed on the inside front cover of this issue of the *Review*. Some general notes applicable to several series are given below.

Seasonal adjustment. Certain monthly and quarterly data are adjusted to eliminate the effect of such factors as climatic conditions, industry production schedules, opening and closing of schools, holiday buying periods, and vacation practices, which might otherwise mask short-term movements of the statistical series. Tables containing these data are identified as "seasonally adjusted." Seasonal effects are estimated on the basis of past experience. When new seasonal factors are computed each year, revisions may affect seasonally adjusted data for several preceding years. For a technical discussion of the method used to make seasonal adjustments, see *X-11 Variant of the Census Method II Seasonal Adjustment Program*, Technical Paper No. 15 (Bureau of the Census, 1967).

Seasonally adjusted labor force data in tables 2–7 were last revised in the February 1980 issue of the *Review* to reflect the preceding year's experience. Beginning in January 1980, the BLS introduced two major modifications in the seasonal adjustment methodology for labor force data. First, the data are being seasonally adjusted with a new procedure called X-11/ARIMA, which was developed at Statistics Canada as an extension of the standard X-11 method. A detailed description of the procedure appears in *The X-11 ARIMA Seasonal Adjustment Method* by Estela Bee Dagum (Statistics Canada Catalogue No. 12-564E, September 1979). The second change is that seasonal factors are now being calculated for use during the first 6 months of the year, rather than for the entire year, and then are calculated at mid-year for the July-December period. Revisions of historical data continue to be made only at the end of each calendar year.

Annual revision of the seasonally adjusted payroll data in tables 11, 13, 16, and 18 begins with the August 1980 issue using the X-11 ARIMA seasonal adjustment methodology. New seasonal factors for productivity data in tables 33 and 34 are usually introduced in the September issue. Seasonally adjusted indexes and percent changes from month to month and from quarter to quarter are published for numerous Consumer and Producer Price Index series. However, seasonally adjusted indexes are not published for the U.S. average All Items CPI. Only seasonally adjusted percent changes are available for this series.

Adjustments for price changes. Some data are adjusted to eliminate the effect of changes in price. These adjustments are made by dividing current dollar values by the Consumer Price Index or the appropriate component of the index, then multiplying by 100. For example, given a current hourly wage rate of $3 and a current price index number of 150, where 1967 = 100, the hourly rate expressed in 1967 dollars is $2 ($3/150 × 100 = $2). The resulting values are described as "real," "constant," or "1967" dollars.

Availability of information. Data that supplement the tables in this section are published by the Bureau of Labor Statistics in a variety of sources. Press releases provide the latest statistical information published by the Bureau; the major recurring releases are published according to the schedule given below. The *Handbook of Labor Statistics 1978*, Bulletin 2000, provides more detailed data and greater historical coverage for most of the statistical series presented in the *Monthly Labor Review*. More information from the household and establishment surveys is provided in *Employment and Earnings*, a monthly publication of the Bureau, and in two comprehensive data books issued annually—*Employment and Earnings, United States* and *Employment and Earnings, States and Areas*. More detailed information on wages and other aspects of collective bargaining appears in the monthly periodical, *Current Wage Developments*. More detailed price information is published each month in the periodicals, the *CPI Detailed Report* and *Producer Prices and Price Indexes*.

Symbols

p = preliminary. To improve the timeliness of some series, preliminary figures are issued based on representative but incomplete returns.
r = revised. Generally this revision reflects the availability of later data but may also reflect other adjustments.
n.e.c. = not elsewhere classified.

Schedule of release dates for major BLS statistical series

Title and frequency (monthly except where indicated)	Release date	Period covered	Release date	Period covered	MLR table number
Employment situation	November 7	October	December 5	November	1–11
Producer Price Index	November 7	October	December 5	November	26–30
Consumer Price Index	November 25	October	December 23	November	22–25
Real earnings	November 25	October	December 23	November	14–20
Productivity and costs (quarterly):					
Nonfinancial corporations	November 26	3d quarter	....	....	31–34
Work stoppages	November 28	October	December 30	November	37
Labor turnover in manufacturing	November 28	October	December 31	November	12–13

EMPLOYMENT DATA FROM THE HOUSEHOLD SURVEY

EMPLOYMENT DATA in this section are obtained from the Current Population Survey, a program of personal interviews conducted monthly by the Bureau of the Census for the Bureau of Labor Statistics. The sample consists of about 65,000 households beginning in January 1980, selected to represent the U.S. population 16 years of age and older. Households are interviewed on a rotating basis, so that three-fourths of the sample is the same for any 2 consecutive months.

Definitions

Employed persons are (1) those who worked for pay any time during the week which includes the 12th day of the month or who worked unpaid for 15 hours or more in a family-operated enterprise and (2) those who were temporarily absent from their regular jobs because of illness, vacation, industrial dispute, or similar reasons. A person working at more than one job is counted only in the job at which he or she worked the greatest number of hours.

Unemployed persons are those who did not work during the survey week, but were available for work except for temporary illness and had looked for jobs within the preceding 4 weeks. Persons who did not look for work because they were on layoff or waiting to start new jobs within the next 30 days are also counted among the unemployed. The **unemployment rate** represents the number unemployed as a percent of the civilian labor force.

The **civilian labor force** consists of all employed or unemployed persons in the civilian noninstitutional population; the **total labor force** includes military personnel. Persons **not in the labor force** are those not classified as employed or unemployed; this group includes persons retired, those engaged in their own housework, those not working while attending school, those unable to work because of longterm illness, those discouraged from seeking work because of personal or job market factors, and those who are voluntarily idle. The **noninstitutional population** comprises all persons 16 years of age and older who are not inmates of penal or mental institutions, sanitariums, or homes for the aged, infirm, or needy.

Full-time workers are those employed at least 35 hours a week; **part-time workers** are those who work fewer hours. Workers on part-time schedules for economic reasons (such as slack work, terminating or starting a job during the week, material shortages, or inability to find full-time work) are among those counted as being on full-time status, under the assumption that they would be working full time if conditions permitted. The survey classifies unemployed persons in full-time or part-time status by their reported preferences for full-time or part-time work.

Notes on the data

From time to time, and especially after a decennial census, adjustments are made in the Current Population Survey figures to correct for estimating errors during the preceding years. These adjustments affect the comparability of historical data presented in table 1. A description of these adjustments and their effect on the various data series appear in the Explanatory Notes of *Employment and Earnings*.

Data in tables 2–7 are seasonally adjusted, based on the seasonal experience through December 1979.

1. Employment status of the noninstitutional population, 16 years and over, selected years, 1950–79

[Numbers in thousands]

NOTE: The monthly data in these tables have been revised to reflect seasonal experience through 1979.

EMPLOYMENT, HOURS, AND EARNINGS DATA FROM ESTABLISHMENT SURVEYS

EMPLOYMENT, HOURS, AND EARNINGS DATA in this section are compiled from payroll records reported monthly on a voluntary basis to the Bureau of Labor Statistics and its cooperating State agencies by 166,000 establishments representing all industries except agriculture. In most industries, the sampling probabilities are based on the size of the establishment; most large establishments are therefore in the sample. (An establishment is not necessarily a firm; it may be a branch plant, for example, or warehouse.) Self-employed persons and others not on a regular civilian payroll are outside the scope of the survey because they are excluded from establishment records. This largely accounts for the difference in employment figures between the household and establishment surveys.

LABOR TURNOVER DATA in this section are compiled from personnel records reported monthly on a voluntary basis to the Bureau of Labor Statistics and its cooperating State agencies. A sample of 40,000 establishments represents all industries in the manufacturing and mining sectors of the economy.

Definitions

Employed persons are all persons who received pay (including holiday and sick pay) for any part of the payroll period including the 12th of the month. Persons holding more than one job (about 5 percent of all persons in the labor force) are counted in each establishment which reports them.

Production workers in manufacturing include blue-collar worker supervisors and all nonsupervisory workers closely associated with production operations. Those workers mentioned in tables 14–20 include production workers in manufacturing and mining; construction workers in construction; and nonsupervisory workers in transportation and public utilities, in wholesale and retail trade, in finance, insurance, and real estate, and in services industries. These groups account for about four-fifths of the total employment on private nonagricultural payrolls.

Earnings are the payments production or nonsupervisory workers receive during the survey period, including premium pay for overtime or late-shift work but excluding irregular bonuses and other special payments. **Real earnings** are earnings adjusted to eliminate the effects of price change. The **Hourly Earnings Index** is calculated from average hourly earnings data adjusted to exclude the effects of two types of changes that are unrelated to underlying wage-rate developments: fluctuations in overtime premiums in manufacturing (the only sector for which overtime data are available) and the effects of changes and seasonal factors in the proportion of workers in high-wage and low-wage industries. **Spendable earnings** are earnings from which estimated social security and Federal income taxes have been deducted. The Bureau of Labor Statistics computes spendable earnings from gross weekly earnings for only two illustrative cases: (1) a worker with no dependents and (2) a married worker with three dependents.

Hours represent the average weekly hours of production or nonsupervisory workers for which pay was received and are different from standard or scheduled hours. **Overtime hours** represent the portion of gross average weekly hours which were in excess of regular hours and for which overtime premiums were paid.

Labor turnover is the movement of all wage and salary workers from one employment status to another. **Accession rates** indicate the average number of persons added to a payroll in a given period per 100 employees; **separation rates** indicate the average number dropped from a payroll per 100 employees. Although month-to-month changes in employment can be calculated from the labor turnover data, the results are not comparable with employment data from the employment and payroll survey. The labor turnover survey measures changes during the calendar month while the employment and payroll survey measures changes from midmonth to midmonth.

Notes on the data

Establishment data collected by the Bureau of Labor Statistics are periodically adjusted to comprehensive counts of employment (called "benchmarks"). The latest complete adjustment was made with the release of June 1980 data, published in the August 1980 issue of the *Review.* Consequently, data published in the *Review* prior to that issue are not necessarily comparable to current data. Complete comparable historical unadjusted and seasonally adjusted data are published in a Supplement to Employment and Earnings (unadjusted data from April 1977 through March 1980 and seasonally adjusted data from January 1974 through March 1980) and in *Employment and Earnings, United States, 1909–78,* BLS Bulletin 1312–11 (for prior periods).

Data on recalls were shown for the first time in tables 12 and 13 in the January 1978 issue of the *Review.* For a detailed discussion of the recalls series, along with historical data, see "New Series on Recalls from the Labor Turnover Survey," *Employment and Earnings,* December 1977, pp. 10–19.

A comprehensive discussion of the differences between household and establishment data on employment appears in Gloria P. Green, "Comparing employment estimates from household and payroll surveys," *Monthly Labor Review,* December 1969, pp. 9–20. See also *BLS Handbook of Methods for Surveys and Studies,* Bulletin 1910 (Bureau of Labor Statistics, 1976).

The formulas used to construct the spendable average weekly earnings series reflect the latest provisions of the Federal income tax and social security tax laws. For the spendable average weekly earnings formulas for the years 1978–80, see *Employment and Earnings,* March 1980, pp. 10–11. Real earnings data are adjusted using the Consumer Price Index for Urban Wage Earners and Clerical Workers (CPI-W).

NOTE: The earnings expressed in 1967 dollars have been adjusted for changes in price level as measured by the Bureau's Consumer Price Index for Urban Wage Earners and Clerical Workers. These series are described in "The Spendable Earnings Series: A Technical Note on its Calculation," **Employment and Earnings and Monthly Report on the Labor Force**, February 1969, pp. 6-13. See also "Spendable Earnings Formulas, 1978-80," **Employment and Earnings**, March 1980, pp. 10-11.

UNEMPLOYMENT INSURANCE DATA

UNEMPLOYMENT INSURANCE DATA are compiled monthly by the Employment and Training Administration of the U.S. Department of Labor from records of State and Federal unemployment insurance claims filed and benefits paid. Railroad unemployment insurance data are prepared by the U.S. Railroad Retirement Board.

Definitions

Data for **all programs** represent an unduplicated count of insured unemployment under State programs, Unemployment Compensation for Ex-Servicemen, and Unemployment Compensation for Federal Employees, and the Railroad Insurance Act.

Under both State and Federal unemployment insurance programs for civilian employees, insured workers must report the completion of at least 1 week of unemployment before they are defined as unemployed. Persons not covered by unemployment insurance (about one-third of the labor force) and those who have exhausted or not yet earned benefit rights are excluded from the scope of the survey. **Initial claims** are notices filed by persons in unemployment insurance programs to indicate they are out of work and wish to begin receiving compensation. A claimant who continued to be unemployed a full week is then counted in the insured unemployment figure. The **rate of insured unemployment** expresses the number of insured unemployed as a percent of the average insured employment in a 12-month period.

An **application** for benefits is filed by a railroad worker at the beginning of his first period of unemployment in a benefit year; no application is required for subsequent periods in the same year. **Number of payments** are payments made in 14-day registration periods. The **average amount of benefit payment** is an average for all compensable periods, not adjusted for recovery of overpayments or settlement of underpayments. However, **total benefits** paid have been adjusted.

21. Unemployment insurance and employment service operations

[All items except average benefits amounts are in thousands]

[1] Initial claims and State insured unemployment include data under the program for Puerto Rican sugarcane workers.

[2] Includes interstate claims for the Virgin Islands. Excludes transition claims under State programs.

[3] Excludes data on claims and payments made jointly with other programs.

[4] Includes the Virgin Islands. Exludes data on claims and payments made jointly with State programs.

[5] Cumulative total for fiscal year (October 1 - September 30).

NOTE: Data for Puerto Rico included. Dashes indicate data not available.

PRICE DATA

PRICE DATA are gathered by the Bureau of Labor Statistics from retail and primary markets in the United States. Price indexes are given in relation to a base period (1967 = 100, unless otherwise noted).

Definitions

The **Consumer Price Index** is a monthly statistical measure of the average change in prices in a fixed market basket of goods and services. Effective with the January 1978 index, the Bureau of Labor Statistics began publishing CPI's for two groups of the population. One index, a new CPI for All Urban Consumers, covers 80 percent of the total noninstitutional population; and the other index, a revised CPI for Urban Wage Earners and Clerical Workers, covers about half the new index population. The All Urban Consumers index includes, in addition to wage earners and clerical workers, professional, managerial, and technical workers, the self-employed, short-term workers, the unemployed, retirees, and others not in the labor force.

The CPI is based on prices of food, clothing, shelter, fuel, drugs, transportation fares, doctor's and dentist's fees, and other goods and services that people buy for day-to-day living. The quantity and quality of these items is kept essentially unchanged between major revisions so that only price changes will be measured. Prices are collected from over 18,000 tenants, 24,000 retail establishments, and 18,000 housing units for property taxes in 85 urban areas across the country. All taxes directly associated with the purchase and use of items are included in the index. Because the CPI's are based on the expenditures of two population groups in 1972–73, they may not accurately reflect the experience of individual families and single persons with different buying habits.

Though the CPI is often called the "Cost-of-Living Index," it measures only price change, which is just one of several important factors affecting living costs. Area indexes do not measure differences in the level of prices among cities. They only measure the average change in prices for each area since the base period.

Producer Price Indexes measure average changes in prices received in primary markets of the United States by producers of commodities in all stages of processing. The sample used for calculating these indexes contains about 2,800 commodities and about 10,000 quotations per month selected to represent the movement of prices of all commodities produced in the manufacturing, agriculture, forestry, fishing, mining, gas and electricity, and public utilities sectors. The universe includes all commodities produced or imported for sale in commercial transactions in primary markets in the United States.

Producer Price Indexes can be organized by stage of processing or by commodity. The stage of processing structure organizes products by degree of fabrication (that is, finished goods, intermediate or semifinished goods, and crude materials). The commodity structure organizes products by similarity of end-use or material composition.

To the extent possible, prices used in calculating Producer Price Indexes apply to the first significant commercial transaction in the United States, from the production or central marketing point. Price data are generally collected monthly, primarily by mail questionnaire. Most prices are obtained directly from producing companies on a voluntary and confidential basis. Prices generally are reported for the Tuesday of the week containing the 13th day of the month.

In calculating Producer Price Indexes, price changes for the various commodities are averaged together with implicit quantity weights representing their importance in the total net selling value of all commodities as of 1972. The detailed data are aggregated to obtain indexes for stage of processing groupings, commodity groupings, durability of product groupings, and a number of special composite groupings.

Price indexes for the output of selected SIC industries measure average price changes in commodities produced by particular industries, as defined in the *Standard Industrial Classification Manual 1972* (Washington, U.S. Office of Management and Budget, 1972). These indexes are derived from several price series, combined to match the economic activity of the specified industry and weighted by the value of shipments in the industry. They use data from comprehensive industrial censuses conducted by the U.S. Bureau of the Census and the U.S. Department of Agriculture.

Notes on the data

Beginning with the May 1978 issue of the *Review*, regional CPI's cross classified by population size, were introduced. These indexes will enable users in local areas for which an index is not published to get a better approximation of the CPI for their area by using the appropriate population size class measure for their region. The cross-classified indexes will be published bimonthly. (See table 24.)

For further details about the new and the revised indexes and a comparison of various aspects of these indexes with the old unrevised CPI, see *Facts About the Revised Consumer Price Index*, a pamphlet in the Consumer Price Index Revision 1978 series. See also *The Consumer Price Index: Concepts and Content Over the Years*. Report 517, revised edition (Bureau of Labor Statistics, May 1978).

For interarea comparisons of living costs at three hypothetical standards of living, see the family budget data published in the *Handbook of Labor Statistics, 1977*, Bulletin 1966 (Bureau of Labor Statistics, 1977), tables 122–133. Additional data and analysis on price changes are provided in the *CPI Detailed Report* and *Producer Prices and Price Indexes*, both monthly publications of the Bureau.

As of January 1976, the Wholesale Price Index (as it was then called) incorporated a revised weighting structure reflecting 1972 values of shipments. From January 1967 through December 1975, 1963 values of shipments were used as weights.

For a discussion of the general method of computing consumer, producer, and industry price indexes, see *BLS Handbook of Methods for Surveys and Studies*, Bulletin 1910 (Bureau of Labor Statistics, 1976), chapters 13–15. See also John F. Early, "Improving the measurement of producer price change," *Monthly Labor Review*, April 1978, pp. 7–15. For industry prices, see also Bennett R. Moss, "Industry and Sector Price Indexes," *Monthly Labor Review*, August 1965, pp. 974–82.

[1] Data for April and May 1980 have been revised to reflect the availability of late reports and corrections by respondents. All data are subject to revision 4 months after original publication.

[2] Prices for natural gas are lagged 1 month.

[3] Includes only domestic production.

[4] Most prices for refined petroleum products are lagged 1 month.

[5] Some prices for industrial chemicals are lagged 1 month.

28. Producer Price Indexes, for special commodity groupings

[1967=100 unless otherwise specified]

Commodity grouping	Annual average 1979	1979				1980								
		Sept.	Oct.	Nov.	Dec.	Jan.	Feb.	Mar.	Apr.[1]	May[1]	June	July	Aug.	Sept.
All commodities — less farm products	234.4	241.4	245.3	247.0	249.5	255.7	260.9	262.9	r264.8	r265.9	267.0	270.3	273.0	273.9

[1] Data for April and May 1980 have been revised to reflect the availability of late reports and corrections by respondents. All data are subject to revision 4 months after original publication.

PRODUCTIVITY DATA

Productivity data are compiled by the Bureau of Labor Statistics from establishment data and from estimates of compensation and output supplied by the U.S. Department of Commerce and the Federal Reserve Board.

Definitions

Output is the constant dollar gross domestic product produced in a given period. Indexes of **output per hour of labor input,** or labor productivity, measure the value of goods and services produced per hour of labor. **Compensation per hour** includes wages and salaries of employees plus employers' contributions for social insurance and private benefit plans. The data also include an estimate of wages, salaries, and supplementary payments for the self-employed, except for nonfinancial corporations, in which there are no self-employed. **Real compensation per hour** is compensation per hour adjusted by the Consumer Price Index for All Urban Consumers.

Unit labor cost measures the labor compensation cost required to produce one unit of output and is derived by dividing compensation by output. **Unit nonlabor payments** include profits, depreciation, interest, and indirect taxes per unit of output. They are computed by subtracting compensation of all persons from the current dollar gross domestic product and dividing by output. In these tables, **Unit nonlabor costs** contain all the components of unit nonlabor payments except unit profits. **Unit profits** include corporate profits and inventory valuation adjustments per unit of output.

The **implicit price deflator** is derived by dividing the current dollar estimate of gross product by the constant dollar estimate, making the deflator, in effect, a price index for gross product of the sector reported.

The use of the term "man-hours" to identify the labor component of productivity and costs, in tables 31 through 34, has been discontinued. **Hours of all persons** is now used to describe the labor input of payroll workers, self-employed persons, and unpaid family workers. **Output per all-employee hour** is now used to describe labor productivity in nonfinancial corporations where there are no self-employed.

Notes on the data

In the private business sector and the nonfarm business sector, the basis for the output measure employed in the computation of output per hour is Gross Domestic Product rather than Gross National Product. Computation of hours includes estimates of nonfarm and farm proprietor hours.

Output data are supplied by the Bureau of Economic Analysis, U.S. Department of Commerce, and the Federal Reserve Board. Quarterly manufacturing output indexes are adjusted by the Bureau of Labor Statistics to annual estimates of output (gross product originating) from the Bureau of Economic Analysis. Compensation and hours data are from the Bureau of Economic Analysis and the Bureau of Labor Statistics.

Beginning with the September 1976 issue of the *Review*, tables 31–34 were revised to reflect changeover to the new series—private business sector and nonfarm business sector—which differ from the previously published total private economy and nonfarm sector in that output imputed for owner-occupied dwellings and the household and institutions sectors, as well as the statistical discrepancy, are omitted. For a detailed explanation, see J. R. Norsworthy and L. J. Fulco, "New sector definitions for productivity series," *Monthly Labor Review*, October 1976, pages 40–42.

LABOR-MANAGEMENT DATA

MAJOR COLLECTIVE BARGAINING DATA are obtained from contracts on file at the Bureau of Labor Statistics, direct contact with the parties, and from secondary sources. Additional detail is published in *Current Wage Developments*, a monthly periodical of the Bureau. Data on work stoppages are based on confidential responses to questionnaires mailed by the Bureau of Labor Statistics to parties involved in work stoppages. Stoppages initially come to the attention of the Bureau from reports of Federal and State mediation agencies, newspapers, and union and industry publications.

Definitions

Data on wage changes apply to private nonfarm industry agreements covering 1,000 workers or more. Data on wage and benefit changes *combined* apply only to those agreements covering 5,000 workers or more. **First-year wage settlements** refer to pay changes going into effect within the first 12 months after the effective date of the agreement. **Changes over the life of the agreement** refer to total agreed upon settlements (exclusive of potential cost-of-living escalator adjustments) expressed at an average annual rate. **Wage-rate changes** are expressed as a percent of straight-time hourly earnings, while **wage and benefit changes** are expressed as a percent of total compensation.

Effective wage-rate adjustments going into effect in major bargaining units measure changes actually placed into effect during the reference period, whether the result of a newly negotiated increase, a deferred increase negotiated in an earlier year, or as a result of a cost-of-living escalator adjustment. Average adjustments are affected by workers receiving no adjustment, as well as by those receiving increases or decreases.

Work stoppages include all known strikes or lockouts involving six workers or more and lasting a full shift or longer. Data cover all workers idle one shift or more in establishments directly involved in a stoppage. They do not measure the indirect or secondary effect on other establishments whose employees are idle owing to material or service shortages.

35. Wage and benefit settlements in major collective bargaining units, 1975 to date

[In percent]

Sector and measure	Annual average					Quarterly average

How to order BLS publications

PERIODICALS

Order from (and make checks payable to) Superintendent of Documents, Washington, D.C. 20402. For foreign subscriptions, add 25 percent.

Monthly Labor Review. The oldest and most authoritative government research journal in economics and the social sciences. Current statistics, analysis, developments in industrial relations, court decisions, book reviews. $18 a year, single copy, $2.50.

Employment and Earnings. A comprehensive monthly report on employment, hours, earnings, and labor turnover by industry, area, occupation, et cetera, $22 a year, single copy $2.75.

Occupational Outlook Quarterly. A popular periodical designed to help high school students and guidance counselors assess career opportunities. $6 for four issues, single copy $1.75.

Current Wage Developments. A monthly report about collective bargaining settlements and unilateral management decisions about wages and benefits; statistical summaries. $12 a year, single copy $1.35.

Producer Prices and Price Indexes. A comprehensive monthly report on price movements of both farm and industrial commodities, by industry and stage of processing. $17 a year, single copy $2.25.

CPI Detailed Report. A monthly periodical featuring detailed data and charts on the Consumer Price Index. $15 a year, single copy $2.25.

PRESS RELEASES

The Bureau's statistical series are made available to news media through press releases issued in Washington. Many of the releases also are available to the public upon request. Write: Bureau of Labor Statistics, Washington, D.C. 20212.

Regional. Each of the Bureau's eight regional offices publishes reports and press releases dealing with regional data. Single copies available free from the issuing regional office.

BULLETINS AND HANDBOOKS

About 140 bulletins and handbooks published each year are for sale by regional offices of the Bureau of Labor Statistics (see inside front cover) and by the Superintendent of Documents, Washington, D.C. 20402. Make checks payable to the Superintendent of Documents. Among the bulletins and handbooks currently in print are these:

Occupational Outlook Handbook, 1980–81 Edition. Bulletin 2075. A useful resource supplying valuable assistance to all persons seeking satisfying and productive employment. $8, paperback; $11 cloth cover.

BLS Handbook of Labor Statistics 1978. Bulletin 2000. A 604-page volume of historical data on the major BLS statistical series. $9.50.

Handbook of Methods. Bulletin 1910. Brief technical account of each major statistical program of the Bureau of Labor Statistics. $3.50.

BLS Measures of Compensation. Bulletin 1941. An introduction to the various measures of employee compensation; describes each series, the manner in which it is developed, its uses and limitations. $2.75.

Occupational Projections and Training Data. Bulletin 2020. Presents both general and detailed information on the relationship between occupational requirements and training needs. (Updates Bulletin 1918 published in 1976.) $3.25.

Technological Change and its Labor Impact in Five Energy Industries. Bulletin 2005. A 64-page study appraising major technological change and discussing the impact of these changes on productivity and occupations over the next 5 to 10 years. $2.40.

BLS Publications, 1972–77. Bulletin 1990. A numerical listing and subject index of bulletins and reports issued by the Bureau from 1972 through 1977, supplementing Bulletin 1749, covering 1886–1971. $1.80.

International Comparisons of Unemployment. Bulletin 1979. Brings together all of the Bureau's work on international unemployment comparisons. Describes the methods of adjusting foreign unemployment rates in 8 countries to U.S. concepts. $3.50.

Productivity Indexes for Selected Industries, 1979 Edition. Bulletin 2054. A 190-page report of indexes of output, employment, and employee hours in selected industries from 1954 to 1978. This edition contains measures for three industries previously not covered, as well as components of previously published measures in 10 industries. $5.50.

Profiles of Occupational Pay: A Chartbook. Bulletin 2037. A graphic illustration of some of the factors that affect workers' earnings. This three-part presentation looks at wage variations among and within occupations and portrays characteristics of high- and low-paying urban areas and manufacturing industries. $3.50.

REPORTS AND PAMPHLETS

Single copies available free from the BLS regional offices or from the Bureau of Labor Statistics, U.S. Department of Labor, Washington, D.C. 20212.

How the Government Measures Unemployment. Report 505. A concise report providing a background for appraising developments in the area of unemployment.

Directory of BLS Studies in Industrial Relations 1960–78. Report 550. A listing of studies prepared by the Division of Industrial Relations as part of the Bureau's regular program of data collection and analysis in the field of industrial relations.

☆U.S. GOVERNMENT PRINTING OFFICE: 1980 O— 341-258/48

MONTHLY LABOR REVIEW

DECEMBER 1980
VOLUME 103, NUMBER 12

Henry Lowenstern, Editor-in-Chief
Robert W. Fisher, Executive Editor

Harold W. Watts 3 **Panel suggests changes in BLS family budget program**
Committee proposes four budget levels applicable to six types of families, and based on median expenditures, rather than detailed commodity lists

Howard N Fullerton 11 **The 1995 labor force: a first look**
All three projections—high, middle, and low—indicate that women will account for two-thirds of the growth, most of which will be in the prime working-age group

David Schlein 22 **Contracts in six key industries scheduled to expire in 1981**
New settlements will cover almost 2.5 million workers during a light bargaining year; unions are still formulating goals—top issues may include safety and job security

A. Neef, P. Capdevielle 32 **Productivity and labor costs abroad**
In 11 industrial countries, manufacturing productivity growth slowed after 1979; unit labor costs accelerated except in Germany, Japan, and the Netherlands

Robert J. Prier 40 **Labor requirements decline for public housing construction**
Each $1 billion spent in 1979 created 28,200 jobs, including 11,700 in other industries; turnkey projects accelerated declines in the employee hours required on the site

Labor Month In Review

UNDERSTANDING THE CPI. In an effort to promote better public understanding of Canada's Consumer Price Index, the Economic Council of Canada has published an excellent booklet explaining the CPI in non-technical language. The booklet will be of interest to U.S. as well as Canadian readers because the Canadian and U.S. indexes, though different in some respects, share many concepts, uses, limitations, and problems, as the following excerpts demonstrate:

Weights. Once Statistics Canada assigns weights to the many items of the CPI, the weights do not change until the index is revised on the basis of new family spending surveys. Thus, between revisions, the CPI "basket" always measures the same quantity of whatever is surveyed, giving it the same importance, to make valid comparisons of price change over time. By holding the quantity and importance of individual items "constant"—necessary for the sake of comparability—the CPI assumes that consumers do not reallocate the elements of their budgets in response to price changes. Such an assumption breaks with reality, of course, but all consumer price indexes in the industrialized world give up a little realism in the interest of creating a useful measurement which give comparisons over time. The risk, naturally, is in losing touch with reality and for that reason Statistics Canada makes revisions, based on family spending surveys, to catch up with events and incorporate them into the CPI.

Substitution. One difficulty inherent in the CPI is that it has no scope for substitution once weights are assigned to the contents of the "basket." However, consumer buying habits are continually in flux as technology improvements and taste changes bring new products on the market and as incomes rise or fall. The faster these permutations in spending patterns, the more the CPI drifts away from reality. Trends such as eating more convenience foods are only incorporated at the time of revision—and then are held constant in the basket until the next revision. In the meantime, incomes tied to changes in a "fixed" CPI will be over-compensated if, in practice, they have substituted cheaper products and services. The CPI measures rising energy prices but does not recognize until the next revision that consumers may be using less energy through conservation or cheaper alternatives; as a result, consumers may have more income left over than what appears from a reading of the CPI.

Housing. Statistics Canada's treatment of housing in the CPI still does not solve the controversial issue—for index purposes—of housing as an asset whose value is changing. But as the CPI measures only price changes in consumption, increasing capital values can be ignored. Certainly this may not be true for individual owners who sell their houses and make a capital gain, but the purpose of the CPI is to reflect—not speculate on—changes in consumer prices.

Deflator. Another widely used application of the CPI is as a tool to calculate "real" income, which provides a view of what happens once the effect of inflation has been removed. Use of the CPI as a "deflator" enables analysts to determine retail sales figures, average weekly wages, and personal expenditures with the inflation factor removed. But there are risks in using the CPI as a "deflator" because, in some circumstances, it may present an inaccurate picture. For example, some but not all taxes are included in the CPI and it may be inappropriate to use the index as a "deflator" for pre-tax wages. Because income tax is not included in the CPI, it is not affected by any changes which may occur in income tax payments. As a result, the CPI is best equipped to deflate after-tax income.

Using the CPI to deflate other concepts of wage income may introduce biases. If governments choose to decrease sales taxes (included in the CPI) and increase income taxes (excluded from the index), then there appears to be an increase in real wages even though the consumer is no better off in real terms than before. In a similar vein, deflation of retail sales may produce incomplete conclusions about what appears to be happening in the economy. If, for instance, increases in energy prices drive up the CPI, it would appear to deflate retail sales even though energy may not be a significant component of those sales. Thus, the CPI as a "deflator" would overcompensate for changes which had not occurred in retail sales.

Limits. The index tells only of the rate of change, not of absolute price increases and will never match one person's monthly shopping basket. However, as a guide to inflation at one level of prices, the CPI is a convenient and useful tool for all the economic partners: government, business, labour, and consumers. In their search for an equitable arbitrator for inflation, they have turned to the CPI because its features lend easily to annual or quarterly adjustments for inflation. As a result, however, the CPI increasingly is assumed to be the final word about inflation, when, in fact, it is only one word.

The 32-page *Toward a Better Understanding of the Consumer Price Index,* by M. C. McCracken and E. Ruddick, is available from the Canadian Government Publishing Centre, Supply and Services Canada, Hull Quebec, Canada K1A0S9. Price is $3.50 in Canada, $4.20 in other countries. □

Special panel suggests changes in BLS Family Budget Program

Committee proposes four budget levels applicable to six different types of families, and based on median expenditures, rather than detailed commodity lists

HAROLD W. WATTS

The Bureau of Labor Statistics' Family Budget Program produces one of the most popular and widely publicized series in the repertoire of labor statistics. It provides annual estimates of the cost of purchasing hypothetical "market baskets" of goods that represent "lower," "intermediate," and "higher" standards of living. The budgets are styled for the traditional four-person family, and for a retired couple. For the worker's family, they estimate a corresponding total income, which provides for taxes and expenses consistent with the three consumption expenditure levels. These budgets are replicated for major cities and for regional averages. They provide the only available basis for inter-area comparisons of living costs or "real" income levels.[1]

In 1978, the Bureau of Labor Statistics contracted with the Wisconsin Institute for Research on Poverty to recommend revisions in the Family Budget Program. The Institute appointed the Expert Committee on Family Budget Revisions, which embodied a wide range of experience related both to methods of developing budget standards and to uses of the standards. The Bureau used similar outside expertise when it reviewed the budgets in 1948 and 1967. The committee and staff, which included members of the Poverty Institute, reviewed the existing program in detail, analyzed new evidence on spending patterns based on the 1972–73 Consumer Expenditure Surveys, and assessed the enlarged possibilities provided by the projected continuous Consumer Expenditure Survey. The panel heard testimony from government experts familiar with the development of the current budgets and commissioned several papers by other experts.

The committee recommended that four American Family Budget Standards be developed in place of the current three budgets. The revised standards have been designed to take advantage of the new information on family behavior collected in the new Consumer Expenditure Surveys. These recommendations have been submitted in the committee's report to the Commissioner of Labor Statistics and are now being considered.

This article explains the basic recommendations and the reasoning behind them. Although the proposed new standards are based on methods that diverge from past practices, they will yield budget totals that are very much in line with the existing series. But a more important continuity—the aim to express normative and quantitative standards that can be used to evaluate relative levels of living among groups, between times and across regions—has been maintained. Because such comparisons yield valuable insights and are widely used in the design and implementation of policy, it is important that they be based on clear and understandable principles. The committee, with only one dissenting vote, believes this report proposes a sound and improved basis

---

Harold W. Watts is a professor of economics at Columbia University and chairperson of the Expert Committee on Family Budget Revisions.

for such comparisons and unanimously recommends a program to study the direct estimation of standards from household attitude surveys. Refinement and validation of the direct methods hold the promise of still further improvements in the Family Budget Program.

Principal recommendations

Budget levels. The committee recommends four levels to replace the existing three budgets:

- Prevailing Family Standard
- Social Minimum Standard
- Lower Living Standard
- Social Abundance Standard

The Prevailing Family Standard, designed to reflect the level of living achieved by the typical family, is set at the median expenditure of two-parent families with two children. In the judgment of the committee, this standard affords a family full opportunity to participate in contemporary society, and to enjoy the basic options it offers. This level is the conceptual descendant of the intermediate budget, but it is also closely related to the traditional "modest but adequate" level of living or the "prevailing standards" of ordinary moderate living.

The other three levels are determined in fixed proportion to this basic standard; standards for other family sizes or types are also expressed relative to the archetypical four-person family. The Lower Living Standard, set at two-thirds of the Prevailing Family Standard, is a successor to the current lower budget. It represents a level that the committee regards as requiring frugal and careful management, leaving little room for choice in achieving what Americans regard as an acceptable standard of living. The Social Minimum Standard is set at half of the Prevailing Family Standard and lies, in the committee's judgment, in a boundary zone below which issues of deficiency and deprivation are appropriate matters of social concern. The Social Abundance Standard, set 50 percent higher than the Prevailing Family Standard (or three times the Social Minimum Standard), rounds out the set by providing a balancing view of a higher living standard. The committee regards this standard as marking the beginning of the expenditure range that increasingly affords choices in the luxury categories of consumption.

Table 1. Recommended equivalence scale and updated values of American family expenditure standards for 1979

Number of persons	Equivalence scale	Social Minimum Standard	Lower Living Standard	Prevailing Family Standard	Social Abundance Standard
1 aged	.50	$ 4,032	$ 5,376	$ 8,064	$12,096
1 nonaged	.54	4,355	5,806	8,710	13,064
2 aged	.61	4,919	6,559	9,839	14,758
2 nonaged	.67	5,403	7,204	10,806	16,210
3	.80	6,452	8,602	12,903	19,355
4	1.00	8,064	10,753	16,129	24,193
5	1.20	9,677	12,903	19,355	29,032
6	1.39	11,210	14,946	22,419	33,629
7	1.57	12,661	16,882	25,323	37,984
8	1.74	14,032	18,710	28,064	42,097
9	1.90	15,322	20,430	30,645	45,968
10	2.05	16,532	22,043	33,064	49,597
11	2.19	17,661	23,548	35,323	52,984
12	2.32	18,710	24,946	37,419	56,129
13+	2.32+ .12 for each over 12	18,710+ 967 for each over 12	24,946+ 1,290 for each over 12	37,419+ 1,935 for each over 12	56,129+ 2,903 for each over 12

NOTE: Assumes no real growth in median income from 1978 value for four-person household.

The committee members

Harold W. Watts (Chairperson)	Columbia University Department of Economics
Anne Draper	American Federation of Labor and Congress of Industrial Organizations, Department of Economic Research; and member, Labor Research Advisory Council, Bureau of Labor Statistics
Lawrence Gibson	General Mills, Marketing Research; and member, Business Research Advisory Council, Bureau of Labor Statistics
James E. Jones, Jr.	University of Wisconsin Law School
Bette Silver Mahoney	System Development Corporation Human Systems Division
Lee Rainwater	Harvard University Department of Sociology
Eugene Smolensky	University of Wisconsin Department of Economics
Barbara Starfield	The Johns Hopkins University School of Hygiene and Public Health

The interfamily equivalence scales. To allow for different family sizes, the expenditure standards for the four-person household are varied using an equivalence scale. The scale recommended has been adapted from the updated "poverty cut-offs" developed by Mollie Orshansky and Carol Fendler, which rely in turn on the relative cost of the "Thrifty Food Plans" provided by the U.S. Department of Agriculture.[2] The proposed scale sets the current expenditure levels for an aged single-person household at 50 percent of the four-person reference standard. A non-aged couple's standard is set at 67 percent of a four-person standard, and that of a family of eight at 174 percent. Table 1 shows the equivalence scale and the full set of levels evaluated for 1979.

The following estimates, based on the 1972–73 Consumer Expenditure Survey, give some idea of the distribution of the population relative to the proposed standards. More than two-thirds of the population lives between the Social Minimum Standard and the Social Abundance Standard; 13 percent are below the Social Minimum Standard, and 18 percent are above the Social Abundance Standard; more than one in four persons live below the Lower Living Standard. The all-too-familiar finding of lower incomes for black persons shows here as a rate of 36.1 percent below the Social Minimum Standard, in contrast to only 10.4 percent for nonblack persons. Children and older persons also show distinctly higher likelihood of living below the minimum and lower chances of living in abundance.

Methods of annual updating. A major objective in developing the recommendations was to provide continuous updating of the standards, based on current information and relatively free of discretionary choices. The recent BLS decision to conduct Consumer Expenditure Surveys on a continuous basis provides a way to keep the budgets up to date that has not existed in the past. The committee recommends that the median expenditures for the reference family type be estimated directly from the annual waves of survey data (using adjacent size groups if needed to enhance precision). For the interim until the survey estimates are available, an estimated expenditure can be obtained by adjusting annual income medians from the Current Population Survey.

Linking the structure of expenditure standards to the median level of the four-person reference family assures that the standards will not be made obsolete by changing economic conditions. Short-run variations in median expenditure levels should not, however, be reflected in norms or standards that gain much of their usefulness from their stability. Consequently, the committee recommends that the expenditure standards be maintained at their previous peak in real terms until a higher real median level is observed. This feature is called a "ratchet." The Consumer Price Index would be used for making the required estimates of real expenditure, thus preventing any decline in the real level of the various standards. During periods of constant or declining real median expenditures the nominal standards would continue to rise in tandem with the general price level, thus staying constant in "real" terms.

Detailed budgets and total income estimates. The new standards have been defined and expressed in terms of expenditure totals. But for many kinds of comparisons and to communicate the meaning of the standards more clearly, further detail is needed. An allocation of expenditures among major categories can be derived from the Consumer Expenditure Surveys. Average allocation patterns can be estimated for each of several types of families at each of the expenditure standards. It must be noted that for any level of total expenditure apparently identical families spend their money differently. These differences are surely due in part to different, but unobserved, circumstances, but there are also differences in tastes and preferences that lead a household to favor one line of consumption over another. Such differences have no apparent ill effect on the interests of the general public and are evidently preferred by the individuals concerned; consequently, the committee feels that to invest the average, or any other allocation, with normative or prescriptive significance is unjustified. The average patterns recommended show plausible allocations because they are based on observed behavior. However, equally plausible allocations can be obtained by trading some expenditures for others, and within a wide range there is no basis for authorative judgment that one is better than another.

The committee proposes that detailed allocations be developed and displayed for six different types of families:

- Two parents and two children (the reference family)
- An aged couple 65 and over
- A non-aged single person
- A one-parent, two-child family
- A two-parent, five-child family
- An aged single person

The budgets would be shown in detail for all four standards, except that the Social Abundance Standard should be omitted for the last three types. There are too few families of those kinds at that level to permit reliable estimation of allocation patterns.

For the non-aged family types, it is also necessary to estimate the level of gross income that will enable a worker's family to spend the amount specified for a given standard. Several adjustments apply here, but income and payroll tax adjustments are the most important and vary from State to State. The committee proposes that calculations based on current Federal and State laws be carried out to determine the tax adjustments needed to arrive at the appropriate equivalent gross income for each State.

Interarea differentials. The committee recommends the introduction of an interarea price index program based on fixed-weight or market-basket procedures. This program should provide price comparisons among all city and regional aggregates for which sufficient price data are regularly collected. While basic price comparisons are useful for many purposes, they do not show the cost of achieving equivalent living levels in different places. This second problem, the "true cost of living" question, cannot be directly resolved by reference to price data *or* to observed expenditure patterns. The committee urges continuing research on this problem, but for the imme-

One committee member dissents

The present BLS Family Budgets are based on detailed cost estimates of items necessary for a worker's family to maintain or achieve specified living standards. Under the proposal of the majority of the Expert Committee on Family Budget Revisions, these would be replaced by a set of declaratory judgments by the committee as to levels of total expenditure, tied to median consumption, that are designated as representing particular living standards.

Even the committee appears rather uncomfortable with this. It produces an ultimate proposal for surveys, that would ascertain public opinion on what is needed to maintain various living standards. Such a project has many useful possibilities as an adjunct to family budget research, and I support it. However, I do not believe it can substitute for systematic budget cost calculations from customary statistical data. In any case the results of such explorations lie far in the future. The immediate question is whether to adopt the committee's specific proposals, based on its judgments.

Why should we accept the committee's judgments? Its answer, in effect, is that the present budgets are equally based on judgments, although less obviously. Thus is discarded a history of Bureau budget-making and evolutionary development that spans more than 70 years. Has the Congress, in commissioning, accepting, and using such budgets, been fooled all this time?

The committee majority objects to the present budgets for their commodity lists, their use of scientific standards and expert opinion, and their elements of relativism. This fails to recognize the purpose of budget-making: estimating costs and making their nature explicit in terms of specific items of purchase, quantity, and price. Necessary costs for a given standard of living are not a mirror image of expenditures taken from a Consumer Expenditure Survey.

The Bureau's work in budget-making, in accordance with Congressional directives, has been skilled and honest. I would have interpreted the mandate of the committee as that of recommending improvements in the methodologies for selecting goods and services to be priced for the worker budgets, not that of overturning the bases of the present budgets in their entirety.

It would be difficult to describe the committee's declaratory judgments on expenditure totals as "methodology." The judgments were not, however, picked out of thin air. Essentially, they were arrived at by consulting the results of other people's judgments, including those of the rejected BLS budget-makers, and converting them to percentage relationships with median consumption figures. It was felt to be important not to have the dollar results diverge markedly from existing numbers that have already been accepted. With acceptable "number" results, the methodology, or lack of it, would not matter.

Thus, the choice of median consumption to represent the Prevailing Family Standard rests essentially upon the present Intermediate Family Budget, which the committee observes to have fallen historically "within the middle range of family incomes." The establishment of the Lower Living Standard at two-thirds of median consumption is pegged at the consumption level of the existing Lower Budget, and is further buttressed by Gallup poll opinion data on "how much it takes to get along." The Social Minimum Standard, set at 50 percent of the consumption median, is similar to other estimates for poverty threshold. When nonconsumption items and taxes are included, it will also be about 70 percent of the Lower Living Standard as referenced in the Comprehensive Employment and Training Act. The Social Abundance Standard, at 150 percent of the median, is simply the obverse of the Social Minimum and rests upon no particular observations or other reference data.

The committee's living standard lines essentially are derivative judgments based on existing estimates, rather than

---

diate future, it recommends that adjustments in fuel and clothing that can be explicitly related to climate differences be recognized as the only basis for interarea adjustments. It is likely that additional adjustments are warranted, but in the absence of consistent evidence of their direction or size, differentials that are based on conjecture may cause more mischief than no adjustments at all.

Measuring popular conceptions of norms. The principles and basic notions that have inspired the new standards suggest the possibility of eliciting normative standards through general public surveys. Recent work in Europe and the United States suggests that people can be asked how much it takes to live comfortably, for example, or to just get along. Their answers can be related to their own income or expenditure levels. From these relationships a consensus can be derived that directly reflects popular views about standard living levels.

Potentially, a measure of this kind could replace the median expenditure standard that forms the basis of the committee's recommendations. All four standards might be estimated separately, for example, and the proportional relationship among them validated or improved. The system of interfamily equivalence scales could also be examined in light of directly expressed requirements of differently composed households. Direct survey questions could also produce independent evidence of interarea differentials.

But at present these approaches need further study and experimental implementation. The committee urges an extensive effort to evaluate these promising new methods. An experimental survey program is practical because the questions required could be added to both the new Consumer Expenditure Survey and other large-scale surveys. The survey program should be carefully designed to identify the best form for the questions. A coordinated analytic program, inside or outside the Buresting upon independent findings or methodologies developed by the committee.

The percentages arrived at are further mandated to remain indefinitely in the same fixed relationships. The Social Minimum is always to be 50 percent of the current year's median, the Lower Living two-thirds, and so forth.

The postulate that adequacy at prevailing levels of living is always at median consumption, and that other standards remain in fixed percentage relationships to the median, is inherently insupportable. In a very poor society, for example, or even our own at different periods in history, median consumption may be the minimum of needed consumption. At other times, median consumption may be well above such a minimum.

The committee's formula is particularly troublesome to contemplate in what may become an era of falling real living levels. There is no genuine safety net to protect whatever is represented in terms of necessary consumption, particularly at the Lower and Social Minimum levels. For the short term, the committee has devised a "ratchet" mechanism. This would obviate the problem by mandating that the median will always be at the real levels of 1972–73, or any subsequent higher real level, as determined through the Consumer Price Index. Under this specification, the "formula" median can readily exceed the actual median, producing a need for complicated explanations. If real living levels are reduced over a long period, the Bureau of Labor Statistics must drop the ratchet and presumably revise the percentages. No guidance is offered concerning when to drop the ratchet or what to do about the percentages. Quantity-cost budgets would no longer be available for guidance.

Regarding geographical or place-to-place variations for national median consumption, the logic of using expenditure totals instead of calculated costs is questionable. Obviously the committee would not want area median expenditures to be the basis for area variations from the national total. This is a problem the committee has not truly resolved, and on which it urges "continuing research." It has endorsed development of an interarea fixed-weight price index, which would ignore local area usage differences for such items as fuel, transportation, clothing, and food preferences. On a separate track, it suggests "climate adjustments" for home fuel use (and possibly clothing) based on degree days in each State; this to represent "living cost" differences on a State basis. The recommendations are incomplete and ad hoc.

The production of equivalent consumption totals for families of different sizes through use of the Orshanky scales is not necessarily objectionable. But, as the committee itself recognizes, this entails no real advance over existing methodologies, all of which are tied to food consumption. The main defect is the failure to detail what any of the budgets actually contain, in terms of tangible goods and services. In the committee formulations, "detail" consists only of percentages allocated to different categories, such as food, clothing, and housing.

In conclusion, I believe that abandonment of the Bureau's traditional quantity-cost budgets would be a grave loss. The budgets have made an independent and substantial contribution to studies of income adequacy. The explicit lists they provide of the commodities and services that go into the budgets are a crucial part of their value. People can judge for themselves whether the lists are reasonably representative of living standards at specified levels.

—Anne Draper
Department of Economic Research, AFL–CIO,
and Labor Research Advisory Council,
Bureau of Labor Statistics

reau of Labor Statistics, should also be developed in order to explore all possible uses of directly elicited living standard estimates.

New socioeconomic report. The final recommendation calls for the design of a new report that can take advantage of the evidence in the continuous Consumer Expenditure Survey, as well as other major Federal surveys, to illuminate the condition of American families and households as consumers. The new budget standards provide a framework in which the population of households and persons can be distributed and the latest information on spending patterns can also be displayed. Such a report would also explicate the annually updated living standards and combine them with revised tax and related adjustments in order to determine the income standards appropriate for each State. In addition to reporting on standard annual series, the report could offer interpretative analytical articles based on expenditure data and methodological articles on possible improvements to the Family Budget Standards Program.

Rationale for the changes

To the small and select group of individuals closely familiar with the Family Budgets Program, it will be evident that these recommendations depart sharply from existing practices. For readers who have used and followed the budget series, but are less familiar with the details of the series construction, this section will point out the main contrasts. The reasoning behind the changes is presented for both groups of readers.

Dollar totals vs. shopping lists. A major and far-reaching departure is proposed in the basic formulation of the budget. The existing budget total can be regarded as the cost of a specific list of goods and services drawn from a variety of sources to characterize a "modest but adequate" standard of living. The proposed Prevailing Family Standard aims at the same general level, but arrives at it by: (1) examining the living standards of a specified and familiar category of household spending a median number of dollars on current consumption relative to others of that type; and (2) taking that level as typifying the ordinary concept of prevailing living standards. Subtotals of expenditure for categories of consumption such as food, shelter, or clothing can be based upon average patterns observed for households at the median level. Illustrative lists of quantities of goods affordable within those totals can also be compiled on the basis of average price data. The critical difference is that the new procedure abandons the notion of a rigidly fixed list of things that are interpretable as minimum *needs* in achieving a given level of living.

Because of evidence that different families commanding the same set of choices select rather different commodities without apparent deterioration in health, vitality, or human dignity, the committee found mistaken the belief that there is a best or unique "recipe" for attaining a living standard. More important, careful examination showed that the existing lists of commodities were in fact not based on objective assessment of needs.

The idea that there are experts who can prescribe what is necessary for a working family to live decently is both widespread and attractive. It promises a basis for claims to "just wages" or "fair treatment" that are apparently supported by the absolute authority of science. Such claims are generally regarded as harder to refute than those based on relativistic standards such as the ones proposed by the committee. The committee might have embraced a set of well-authenticated needs that could be translated directly into costs. But no experts could be found who were willing to formulate such requirements. Nutritional experts can combine agreed-upon nutritional requirements (that can, in themselves, be satisfied at very low cost) with palatability limits and evidence related to food preferences to produce any number of need-filling food quantity lists. These lists have differing costs, and most people would prefer a higher cost "food plan" over a lower one. But the nutritional criteria provide no basis for choosing one plan over another, and the actual choice of a plan for the existing budget depends on relativistic measures that are no less arbitrary than the committee's proposal to assign median total expenditure as a standard of comparison.

Physical standards for housing have also been used in forming the budgets but, again, the standards do not determine a unique cost. The selection from among the wide range of values and prices of units that meet the standard is made by applying arbitrary and relativistic standards. Yet food and housing are usually considered the best cases for application of expert or scientifically sanctioned standards. The same recourse to arbitrary and essentially relative criteria was apparent at all stages of development of the quantity lists currently used for the family budgets.

The majority of the committee concluded that the main claimed advantage of lists of qualities of goods and services—that such lists assure the meeting of authoritatively established needs—was in fact illusory. Any cost total derived from lists of commodities has perforce been based on a myriad of individual judgments. Consequently, the committee majority, recognizing that a judgment based on individual values and *not* on scientific requirements must be made at some stage whatever the method used, decided to exercise that judgment in the choice of an expenditure *total* rather than in several hundred item choices.

It must be emphasized that the decision did not involve rejection of scientific or expert-based cost of living criteria. What was rejected was a complex and often obscure set of judgmental choices that has often and mistakenly been confused with scientific or expert-based standards. The theoretical and practical possibility of deriving genuine scientific quantity standards was also explored, but no promising new approach to determining detailed quantity lists was discovered. Finding no alternative to relying on its collective experience and judgment in assigning numerical totals to the more abstract notion of living standards, the committee chose an alternative that makes the exercise of judgment both explicit and "out front." The committee believes that family budgets based on its recommendations will be at least as useful as the current budgets but very much hopes that unsupportable claims will *not* be made by those who use them.

However, the family budgets do need an explicit conceptual base, and if the authoritative list of needs is abandoned, what is the alternative that informs the recommendations? The alternative is the notion of a popular or democratic consensus about norms or standards of comparison. The committee asserts that there is a general consensus about how much it takes for an ordinary family to "get along"—perhaps not an exact figure, but rather a range or "band" of total expenditure levels that contains what most people would agree is the "get along" amount. Similar consensus may be defined for thresholds for deprivation or abundance, and survey research, both in Europe and the United States, has been able to measure these levels.[3]

Assuming the existence of such norms as social facts, the committee addresses the task of finding acceptable ways of eliciting and expressing them in quantitative detail. The majority of the committee believes the reason the existing practice has been acceptable is that the numbers arrived at are consistent with the popular norms, not that they were derived from expert judgment. If "experts" had decided that everyone must have new shoes every week, for example, resulting budgets would have been widely rejected as outside the consensus for such norms. But it also follows that any method of establishing norms that succeeds in approximating the consensus will be reasonably well-received and found useful.

But this view of norms also suggests that a more direct way to elicit them would be to inquire about them in surveys. For this reason the committee recommends a major effort to evaluate and perfect the survey method so that it eventually may be considered in designing possible alternatives for the methods already recommended in this report.

In short, this report recommends a basic shift toward a more populist or democratic framework—the notion that ordinary people, not experts, know what they need in order to get along or to prosper. Thus, recommendations for new measurement are directed toward the task of finding stable and reproducible estimates of those levels.

Related differences. There are several implications of the basic change. First of all, in order to determine the cost of the shopping list, the existing budgets require current price data on the listed items; the process of updating the cost, between list revisions, similarly depends on a continuous flow of appropriate price data. The proposed approach does not require price data to establish a "bottom line" total cost number, but it does require continuous survey data on household expenditure behavior both for the total cost and for the current allocation among different lines of expenditure. Since price data would no longer be needed for the Family Budget Program (except for the "ratchet" computation which prevents reductions in real budget levels), the committee recommends that fixed-weight price index numbers be developed for inter-city and inter-regional comparisons. The existing budgets provide cost differentials that are often used as price differentials. The committee urges that the price data be kept separate from the budgetary norms but recognizes that each has its legitimate use and urges that both be surveyed and published.

Unlike the existing budgets which are shown only for specific cities and for regional aggregates that do not have homogeneous tax laws or climate, the new budget standards would be designed to cover all areas, State by State. In the event that dependable and consistent estimates of differential living costs according to urbanization can be formed, they could be added to the array of variations. But this should be done on a size or type-of-place basis rather than for specific cities. Because price data are collected only for specific cities, the committee recommends that the price comparisons be limited to those same cities.

The change in concept also implies a shift from an "absolute" to a "relative" standard, at least to the extent that the underlying, popularly conceived norms will be based on what the individuals are experiencing directly and on what they see going on around them. If the underlying norms can be faithfully reflected in the family budgets, they will automatically keep pace with the constantly changing levels and patterns of expenditure that correspond to the different standards. The absolute standards embodied in detailed lists of commodities must be overhauled periodically; only for a very short time do they approximate the patterns and items of actual current spending. (Pedal pushers, for example, are among the anachronistic items in the current budgets.)

Equivalence scales and family types. The proposed approach to the family budgets allows for extension of the budget levels and allocations to as many family types as desired. The committee recommends only six, but it would be possible to prepare other budgets of the same type on short notice if needed for special purposes. The equivalence scale provides an adjustment factor for calculating the appropriate budget total for any kind or size of family, and the most recently estimated expenditure allocation system will yield average patterns of spending for each. Finally, the tax and "other expense" categories can be calculated and added to yield a total "gross income" requirement for maintaining the standard for each kind of family. With the existing system a whole new list of goods and services must be specified for each separately budgeted family type. Clearly the size of this task has been an obstacle to providing coverage for a wider variety of family types. While the existing program has its own set of equivalence scales that can be used to adjust the four-person spending totals, they have never been widely used or given prominent attention.

ALTHOUGH THE COMMITTEE recommends substantial changes in the way family budgets are conceived, estimated, and presented, the new standards are very much in line with the traditional ones. The levels that have been chosen provide essential continuity with those that have been developed and found useful in the existing program. Consequently, the typical user will not notice any sharp change in the overall appearance of the budgets despite the sharp change in methodology. If the recommendations are accepted the committee believes that the broader coverage of the budgets, both as to family types and areas, will make the budgets useful for a wider range of users and that the proposed new Report on Household Consumption will add an important dimension to our array of social indicators. ☐

FOOTNOTES

[1] A large part of the estimates were based on analysis of the 1960–61 Survey of Consumer Expenditures. Given the availability of data from the 1972–73 Consumer Expenditure Survey and the mandate of the Comprehensive Employment and Training Act (CETA) of 1973 that "the Secretary (of Labor) shall develop methods to establish and maintain more comprehensive household and budget data at different levels of living, including a level of adequacy, to reflect the differences of household living costs in regions and localities, both urban and rural," the Bureau of Labor Statistics began to plan for a comprehensive revision of the Family Budget Program.

Inflation's diffused pattern

Inflation is characterized by a general and widely diffused rise in prices and costs. However, all prices and factors affecting prices do not begin to rise or fall at the same time. In part, this is due to the existence of more or less regular sequences in the movement of different prices. Prices in some markets almost always begin to rise more promptly than in other markets. Similarly, some prices typically begin to fall sooner than others.

Moreover, prices do not all move at the same pace, and in particular, they do not necessarily move at the same pace as wages or costs of production. Prices of some types of assets, such as common stocks or land, rise or fall, while the money price of other assets, such as savings accounts or debt instruments, may not change at all. These differences in price behavior have significant consequences. Real wages—money wages adjusted for price changes—may rise or fall, with vital effects on the wage earner and his family. Profit margins, dependent on the difference between prices and costs, may rise or fall, thereby encouraging or discouraging expansion of production, development of investment plans, or shifts of resources from one activity to another.

The 1995 labor force: a first look

All three projections—high, middle, and low—indicate that women will account for two-thirds of the growth, most of which will occur in the prime working-age group; the black labor force will grow twice as fast as the white force

HOWARD N FULLERTON, JR.

By the mid-1980's, persons in the labor force are projected to exceed those not in the labor force—including babies. This development reflects the changing age composition of the population which, in turn, is caused by the swings in births over the past 50 years. By 1995, this labor force would have a greater proportion of women and minorities; indeed, about two-thirds of the labor force growth would be generated by women, reflecting their continued labor force participation.[1]

The projections discussed in this article are part of a continuing program of economic projections made by the Bureau of Labor Statistics. As part of this program, every 2 years labor force projections are prepared, followed by projections of the economy, of employment by industry, of demand, and ultimately, of occupations by industry.

The Bureau of Labor Statistics developed three labor force growth scenarios: a *high-growth* projection, which assumes rapid growth in the labor force participation of women in the 1980's and the convergence of participation between black men and white men under age 65; a *middle-growth* scenario, with the expansion coming from women; and a *low-growth* path with only moderate increases in the participation of women and with the divergence in male participation between races continuing.[2]

In the intermediate scenario, the labor force is projected to reach 115 million by 1985 and 128 million by 1995. (See table 1.) This represents 1.8 percent growth per year from 1979 to 1985 and 1.0 percent per year from 1985 to 1995. (See table 2.) Under this scenario, labor force rates of women age 20 to 44 are assumed to rise at an increasing rate until 1983. For most age groups of men, participation is projected to decline, although not as fast as it did in the 1970's. Overall participation is assumed to increase more rapidly for whites than for blacks.[3]

In the high-growth scenario, the labor force is projected to grow 2.3 percent per year between 1979 and 1985 and 1.1 percent per year between 1985 and 1995. Under this scenario, about 135 million persons would be in the labor force in 1995. The participation rates for women age 16 to 19 and 45 to 64 are projected to grow at an increasing rate until 1985, before tapering off in the 1990's. The rates for white men age 25 to 39 are assumed to rise, reversing a long-term drop since 1960. By the end of the century, the labor force participation ratio of black men are projected to converge to the ratio of white men. (With the higher rate of black involvement in the Armed Forces and higher rates of institutionalization, the civilian labor force rates for

---

Howard N Fullerton, Jr., is a demographic statistician in the Office of Economic Growth and Employment Projections, Bureau of Labor Statistics.

some age groups of black men would exceed those of white men.) However, because blacks make up about 12 percent of the labor force, this assumption of the high-growth scenario does not have a significant impact on the level of the overall labor force.

In the low-growth scenario, the labor force is projected to grow 1.1 percent a year from 1979 to 1985 and 0.8 percent from 1985 to 1995. By 1995, the civilian labor force is projected to be only 122 million. The participation rates of women age 20 to 44 are projected to rise over the entire period, but at a decreasing rate. For other age groups of women, participation is assumed to increase at a slower rate than in the middle-growth path, reflecting a longer run experience than that in the 1970's. For men, labor force activity is projected to decrease more rapidly than in the middle-growth scenario, leading to an increased disparity in rates by race.

Women provide most growth

As a base for these projections, we used the population projections prepared by the Bureau of the Census. Under the Series II (middle) projection, the population 16 and older grows steadily through 1995, although the decrease in births (which began around 1960) means slower rates of growth during the remainder of this century.[4] (See table 3.) Because of reduced birth rates during the 1930's and the 1970's and the baby boom of the 1950's, the age composition of the population and, thus, of the labor force will change significantly during the next 15 years.[5]

In the past, much of the increase in the labor force has been generated by the entrance of youth and women. The number of new labor force entrants could drop in the future because there will be fewer youths. This means that the labor force would consist of more experienced workers than now. By 1985, the small number of persons born during the Great Depression will begin to leave the prime working ages. They will be replaced by the more populous baby-boom generation; the growth of the older population will be slowed.

More than two-thirds of the 1980–95 labor force growth would come from women. (These projections do not yield estimates of new entrants and of re-entrants.) Women are expected to compose an additional 4 percent of the labor force in 1995 under each of the three patterns of labor force growth. The increase in the proportion of employed women in the prime working-age group would more than offset the decreasing proportions of younger and older working women. On the other hand, the proportion of men in the labor force is assumed to be slightly less. Under the medium- and low-growth scenarios, the activity rates of men age 25 and over is expected to drop. Under the high-growth path, the rates for men age 40 to 64 are projected to remain constant and the rates for men age 25 to 39 will increase slightly. Rates for men and women under age 25 are moving up, but those for women are increasing faster. In the older age groups, where rates for men and women are dropping, those for men are dropping faster. Hence, women's increasing share of the labor force reflects their own greater activity as well as the decrease in male participation.

Until recently, labor force participation has been dropping for most age groups of black men, while their population has been increasing at a higher rate than that of whites. As the black population continues to grow at a faster rate, the black labor force also can be expected to grow at a faster rate. Thus, under all three projections, the black labor force is growing considerably faster—at about twice the rate of whites. That the relatively rapid growth is related to population growth may be seen by comparing possible participation rates. Under middle and low scenarios, the overall rate is lower for blacks than for whites. Under the high-growth scenario, which assumes convergence of male total participation ratios for blacks and whites, black civilian la-

NOTE: Compounded continuously.

bor force participation exceeds that of whites by 1995. (This reflects, for black women, an expected continuation of higher participation and, for black men, higher rates of institutionalization and of participation in the Armed Forces.) Under the middle and low scenarios, the racial gap in male participation rates is projected to approximately double from the percentage point difference in 1979.

The above description of population and labor force changes suggests that the discussion of future labor force trends should focus on two periods, 1979 to 1985, and 1985 to 1995. During 1979–85, the teenage and young adult population will decline in absolute numbers and the prime-age population will grow sharply. During 1985–95, the older adult population will grow at a slower rate. Further, during the late 1980's and early 1990's, women of the baby-boom generation will pass their prime childbearing ages.

The changing labor force, 1979–85

A look back to 1975 will help our gaze forward to 1985. In 1975, the total fertility rate was 1.8 children per woman; for 1985, the Census Bureau's Series II population projection is for 2.0 children per woman.[6] Because the total fertility rate adjusts for changing age composition, there would be an increase in births from the levels of the 1970's. This increase in fertility rates, coupled with the increase in the labor force participation of women, means there would be more working mothers.

In 1975, 46 percent of all women were in the labor force. By 1985, this is projected to increase to 56.4 percent under the middle-growth scenario. (See tables 4 and 5.) This dramatic increase reflects both the movement of women of the baby-boom generation into the prime working-age group and the projection of increased activity rates. In 1975, women represented 40 percent of the labor force—by 1985 they would represent about 45 percent. The percents do not vary much across scenarios.

Slow growth for youths. Since the early 1960's, the youth population (age 16 to 24) has been growing at a faster rate than has the older population. However, 20 years have passed since the years of peak births, and the size of this age group has begun to fall. Thus, with the aging of the baby-boom cohort, the numbers of those age 16 to 24 almost certainly will decline so that, despite a projected increase in their labor force participation rates, the level of the youth labor force would fall. (Of course, the drop would not be as sharp as that for the population component.)

The composition of the younger population will also be affected by the difference in fertility between blacks and whites. Although fertility for both groups has been falling, black fertility rates remain higher. As a consequence, the black population is younger (the median age is lower), and the youth population will have a greater proportion of blacks than will the population age 25 and over. At the same time, black youths have lower labor force participation than do their white counterparts, so if other things remained the same, the

growth of the youth labor force would be slower. (See table 6.)

The number of black youths should increase slightly while the number of whites should drop. Only black young men had lessening labor force participation during the 1970's. Under the middle-growth projection, this drop is assumed to continue, although at a decreasing rate. The effects of greater labor force participation by black women and a proportionately larger youth population would offset the decline in male participation, and black youths would constitute the same proportion of the labor force in 1985 as at present. Under both the middle- and high-growth projections, the black youth labor force would be half men and half women. In the high-growth scenario, black youths represent an even greater proportion of the labor force in 1985; the more pessimistic low-growth pattern yields a lower proportion.

Prime-age labor force. The prime-age workers (25 to 54 years) would be the fastest growing component of the labor force under each of the growth paths. The following tabulation shows annual growth rates by major age group and race, 1975–79, and projected growth for 1979–85:

	1975–79	*1979–85*
Youth	3.2	−0.6
Prime	3.0	3.0
Older	.2	.7
White	2.6	1.7
Black and other	4.0	3.0

In each scenario, the prime-age labor force of women would grow at a faster rate than that of men. Under the high projection, between 1975 and 1985, the female labor force is projected to grow at twice the male rate and at a pace faster than that experienced in the 1970's. This is due to three factors: the movement of women of the baby-boom generation into this age group, a moderate rise in fertility, and a continued growth in female labor force participation. The high-growth scenario for women in this age group is an attempt to reflect the acceleration in participation that was exhibited in the 1970's.

Under the high-growth scenario, prime-age men (particularly young men), are also expected to experience an increase in participation. Under the high-growth path, prime-age men would represent 78 percent of the total male labor force, a moderate increase from 1979. Under the middle-growth path, such trends would also be evident, although less significantly. For example, by 1985, prime-age male workers would represent only 75 percent of the male labor force. With the more pronounced drop anticipated under the low-growth scenario, the proportion of prime-age men would be less than in 1975, while their female counterparts would be more than 10 percentage points higher than in 1975.

Older workers. Older people (age 55 and over) have the most on-the-job experience, although on average, they have the least formal education. From 1979 to 1985, older workers are expected to participate less intensively in the labor force. These projections do not indicate the extent of part-time labor force activity that this growing segment of the population might elect.

Under the high-growth scenario, men age 55 to 64 are expected to have only a modest decrease in participation. This decrease, coupled with population growth, will result in an increase in their labor force. Under the

other two scenarios, their participation is expected to drop more sharply, and the male labor force age 55 to 64 would actually decrease. Participation rates for women in this age group are expected to increase under both the moderate- and high-growth projections. The result would be an older labor force with proportionately more women.

The scenarios in these projections for the age group 65 and over are the same for both sexes. For the high projection, recent legislation forbidding mandatory retirement before age 70 is expected to hold participation constant. Under the moderate-growth scenario, the measured rate of decrease in participation is reduced somewhat, so that labor force activity drops at a slower rate than in the past. Under the low-growth projection, the measured declines in labor force participation are projected to continue.

An experienced labor force, 1985–95

During 1985–95, the baby-boom generation will be in the prime working ages and the relatively small number of persons born in the Great Depression will begin retiring, easing pressures on retirement systems.

To put the 1995 projections in context, it is useful to look back to 1965, a time of the buildup of forces in Vietnam and a period of lower inflation. The fertility rate was 2.9 children per woman, well above the Census Bureau's Series II projection of 2.1 for 1995.[7] In fact, 1965 was the first year in which births were below 4 million—after 11 years of high birth rates. In 1965, 40 percent of all women, 34 percent of all married women, and 23 percent of mothers with children under age 6 were in the labor force. Although comparable projections of the labor force by marital and parental status were not made by the Bureau of Labor Statistics for 1995, more than half of all married women were already in the labor force by 1979, as were 45.2 percent of mothers with preschool children. Both groups (which, of course, overlap) are projected to supply much of the labor force growth in the 1990's.

Youths. In 1965, youths were a relatively small proportion of the labor force, 18 percent. By 1979, this number had climbed to 24.4 percent. The effects of changes in the composition of the labor force may be seen by looking at the median age of the labor force. In 1965, it was 40 years; by 1979, it had dropped 5 years, taking the effects of both greater retirement and the aging of the baby-boom generation into account; by 1995, the median age of the labor force is projected to be 37.5 years.

Based on the Census Bureau's Series II birth rate projection, the youth labor force would continue to decrease from 1985 to 1995, although a larger proportion of teenagers would participate in the labor force. Only under the high-growth pattern would young men age 20 to 24 have a greater participation rate than in 1979. By 1995, the youth labor force would be a smaller proportion of the labor force than in either 1979 or 1985.

Prime-age workers. By 1995, more than 70 percent of the labor force would be in the prime working ages. For the middle- and high-growth scenarios, this is actually a lower proportion than in 1985. The projected growth for prime-age men is about the same under all three scenarios; consequently, even after the growth in female participation is taken into account, the prime-age labor force is still more stable over the scenarios than that of the younger and older age groups. (See table 6.) In the middle- and low-growth projections, it is assumed that the youth and the older labor force grow relatively slower than the prime-age labor force, so these scenarios have a higher proportion of prime-age workers. However, the greatest number of prime-age workers would be attained under the high-growth pattern. Under all projections, the labor force would have more women and more blacks than now: 47 percent of the labor force would be women, and 14 to 15 percent of the labor force would be black. Following are selected annual growth rates (in percent) of all persons in the labor force, by major age group and race, 1965–79, and projected growth to 1995:

	1965–79	*1979–95*
Youth	3.9	−0.9
Prime	2.2	2.3
Older	.4	−.2
White	2.3	1.2
Black and other	2.8	2.5

Older workers. Under all scenarios, workers age 55 and older would continue to be a decreasing proportion of the workforce. The changes for the 25 years from 1970 are most dramatic in the low-growth projection—in 1995, older workers would constitute about two-thirds the proportion of the labor force that they did in 1970. This drop reflects both their expected continued drop in participation and the increase in the numbers of persons in the prime working ages, when participation is highest. The drop in the proportions for the middle- and high-growth paths is less extreme, from 14 percent in 1979 to around 11 percent in 1995.

How the projections were revised

The uncertainty of the projection process is indicated by the changes from the 1978 set.[8] (See table 7.) The difference between the high and low in 1985 and 1990 is about the same as that in the 1978 projections; the current middle projection is midway between the previous middle and high. Each scenario, high, middle, and low was revised upward—the low one the most, to almost

the level of the previous middle-growth path. The changes reflect the effects of two additional years of observations, as well as changes in the assumptions made for women age 20 to 44 mentioned earlier. They also reflect the general experience that it is more difficult to project an increasing phenomenon.

In 1990, the projected number of women would be about 2.5 million higher under each scenario, but the proportion of the labor force in each major age group differs among scenarios. Under both the high and middle scenarios, the number of young women in the labor force would be smaller than in the previous projection, reflecting their slower participation growth. For women in the 20 to 44 age group, the 1978 projection included an adjustment to the high-growth scenario to reflect accelerating participation rates; in the current projection, this assumption was formally introduced in both the middle- and high-growth scenarios.

The differences between the two sets of projections are less uniform for men. The number of men in the labor force is essentially unchanged in the high-growth scenario; in the low and middle scenarios the number of men is projected to increase. The Bureau of Labor Statistics typically revised downward the number of men in the labor force with each succeeding labor force projection (while increasing the number of women). These changes reflect the slowing or ending of the decline in male participation rates. For the high-growth scenario, it is assumed that male participation rates will either rise or at least hold constant.

To summarize, for each scenario, the number of women expected to be in the labor force was revised upward by about the same amount. For men, the high-growth projection was approximately the same as the last projection, the middle-growth path was revised upward slightly, and the low-growth path was revised upward significantly.

Possible consequences

A number of questions could be asked about the possible consequences of the changes in the structure of the population and of the labor force in these projections. Would these changes affect the ability of society to maintain the responsibilities it has assumed, such as social security? Could the changing composition of the labor force make goals such as equal employment opportunity easier or more difficult to accomplish? Is there potential for changes in productivity? Will there be scarcities of certain kinds of workers? How would migration affect the composition of the labor force?

Societal responsibilities. One of the implications of these projections is the change in the "economic dependency ratios" for both the high and middle projections. The economic dependency ratio is defined as all persons not in the labor force (including those under age 16) divided by the total in the labor force.[9] This ratio should drop to below 100 nonworkers per 100 workers. Under the conditions of the middle-growth pattern, the dependency ratio would stabilize after 1990. Under the conditions of the high-growth scenario, (which assumes higher participation), the dependency ratio drops significantly; in fact, it shows no sign of leveling off in this century. Under the conditions of the low-growth projection, the dependency ratio would stabilize above the 100-nonworker-per-100-worker level, but well below historic levels. The following tabulation shows dependency ratios for 1965–79 and projected ratios for the three scenarios, 1985–95:

		Projected		
	Actual	*Middle*	*High*	*Low*
1965	151.8	...	...	...
1970	138.5	...	...	...
1975	125.4	...	...	...
1979	110.1	...	...	...
1985	...	98.8	93.5	104.5
1990	...	95.6	87.0	103.4
1995	...	94.5	84.4	104.1

These favorable ratios are a characteristic of the age of the baby-boom cohort and of the numbers of projected births. A large labor force is combined with low births to give low economic dependency ratios. As the baby-

[1] The previous projections were published in Paul O. Flaim and Howard N Fullerton, Jr., "Labor force projections to 1990: Three possible paths," *Monthly Labor Review*, pp. 25-35, December 1978.

[2] A minus sign indicates that the current projection is lower than the previous projection.

boom cohort leaves the prime working ages (after 2015), the dependency ratios should rise again, although the higher mortality of older people will prevent it from reaching the levels of the 1960's. Differences in the number of older people are a consequence of past fertility—not improvements in mortality—but if spectacular increases in longevity occur, this could change.[10] Thus, the current difficulties of the social security system are not a result of the current age composition of the population. This favorable age composition effect on social security almost certainly will reverse in the early part of the next century.

Black-white differentials. One dilemma confronting labor force forecasters and policymakers concerned with employment and training programs has been the continued divergence of labor force participation between blacks and whites in the prime-age groups. As recently as the mid-1950's, the rates for men were virtually the same; but since then, the participation rates for black men have dropped more rapidly than those for white men. The high-growth scenario projects a possible return to parity of their labor force rates. The extent to which black rates have to increase is a measure of the problems that have to be confronted. In numbers, about 1.3 million more black men would participate in the high than in the middle-growth path labor force. For women, the picture has been different; in 1979, the rate for prime-age black women was higher than that for their white counterparts (despite higher fertility among black women). Moreover, participation of women in both groups is increasing, although faster for whites.

The differences in female participation reflect the greater family responsibilities of black women—more are single parents than are whites, although the number of such white women is increasing.[11] The higher fertility of black women obviously translates into higher population growth and then into higher labor force growth. Thus, the youth groups of the 1980's and 1990's will have a higher proportion of blacks.

Productivity. One question raised by these projections is the effect of a proportionally greater prime-age labor force on productivity. The proportion of prime-age workers will increase at least by 10 percentage points (with the low-growth projection having the greatest concentration in the prime ages). Analyses have centered on the relative size of the youth labor force (which will diminish) and on the likely impact this would have on productivity gains.[12] The growing proportion of the prime-age labor force should have a favorable impact on productivity because of the greater continuity of participation by women and because of the higher educational attainment of all age, sex, and ethnic components.[13]

In the 1980's and 1990's, employers may have increasing difficulty finding young workers. The decline in the number of youths will be particularly important to the Armed Forces—the largest single employer of youths. Given the decrease in the youth labor force, those who employ unskilled workers may also experience difficulty—depending to some extent on the Nation's immigration policy.

The growth of the prime-age labor force would exceed that of the overall labor force by 20 percent. Because this is the experienced component of the labor force, analysts who look for a shortage of skilled workers must consider likely changes in the composition of the prime-age labor force. More than half (59 percent) of the growth is projected to be generated by women and 22 percent by blacks (black women are in both groups). Skilled and professional workers will have to come from these groups in greater numbers than in the past if there is not to be a shortage.

In the U.S. labor market, there is a tradition of male occupations and of female occupations, and there has been little change in this pattern.[14] The growth in female participation has occurred largely in occupations traditionally held by women. What would happen if demand would no longer grow in those sectors? The argument has been presented that higher participation would be translated into greater continuity of work and, thus, into more capacity to retain skills and professional abilities that diminish if not used. Given that much of the increase in female labor force activity will probably come from mothers, employers may have to review their personnel practices (such as provision of day care) to attract these workers.[15]

By 1995, the youngest of the baby-boom generation will be in their thirties. They may well face competition for career positions which may result in frustration for some and greater productivity for all. The older members of the baby-boom generation will be in the preretirement years and should be at the peak of their productivity.

Immigration. Along with growth in the native adult population and increased labor force activity, immigration represents a possible source of labor force growth. For purposes of this discussion, migration can be divided into two groups, legal or "documented" migration and illegal or "undocumented" migration. The Bureau of the Census projects that "documented" net migration will average 400,000 persons a year, with bulges in a few years such as 1976 and 1980 when large numbers of refugees reached our shores. To estimate the proportion of the labor force growth that net migration represents, we can look at 1979. The labor force participation rate for those age 16 and older was 63.7 percent. If the comparable rate for the migrant population was about the same, and ignoring the fact that there are proportionately fewer older persons in the migrant population, some 173,000 would have been in the labor force in 1979, or about 7 percent of the actual labor force growth.[16] Documented workers vary from those with high skills (the brain drain) and professional athletes to lower skilled agricultural and service workers.

Undocumented workers also represent a variety of skills, from college graduates to unskilled workers. By their nature, we know little about these people as a group. The discussion that follows is based on a study conducted by Jacob S. Siegel, Jeffrey S. Passel, and J. Gregory Robinson for the Select Commission on Immigration and Refugee Policy.[17] After a review of past estimates, they concluded that there are 3 to 6 million undocumented workers in the United States. It is important not to confuse the *stock* of undocumented workers with the *flow* of documented workers discussed in the preceding paragraph. The only information available about flows of undocumented workers is for Mexicans. There appears to be considerable movement in both directions netting to zero (with large seasonal fluctuation). There is no way of ascertaining what portion of undocumented workers, if any, are currently accounted for in existing labor force data. Therefore, no changes have been made to the projections to account for undocumented workers.

Obviously, these last few paragraphs have raised rather than answered questions about the implications of the changing structure of the labor force. The topics discussed here illustrate some uses for which these projections have been generated; there also are other uses. ☐

FOOTNOTES

These projections replace those described by Paul O. Flaim and Howard N Fullerton, Jr. in "Labor force projections to 1990: three possible paths," *Monthly Labor Review*, pp. 25–35, December 1978.

[2] These scenarios are prepared by projecting the changes in the ratio of the total labor force to the total population for each of 54 age-sex-race groups; the levels of the anticipated labor force were calculated by applying the projected rates to the Bureau of the Census' population projections. The high and low scenarios do not represent "confidence intervals," but rather different views of the future. A complete methodological statement is in preparation.

[3] The term "blacks" refers to black and other races, which includes Negroes, American Indians, Eskimos, and others. At the time of the 1970 Census of Population, 89 percent of this population group was black.

Contracts in six key industries scheduled to expire in 1981

New settlements are expected to cover almost 2.6 million workers in this light bargaining year; unions are still formulating goals, but several have indicated that safety and job security may be among the issues pressed

DAVID SCHLEIN

Following 2 years of relatively heavy bargaining activity, collective bargaining in 1981 will be light. About 2.6 million workers are covered by major agreements expiring or reopening in 1981, compared with approximately 3.7 million in both 1979 and 1980.[1] Except for the airline industry, which has negotiations scheduled throughout the year, most of the talks will occur before midsummer. Contracts in the railroad and coal industries expire in March; contracts in the maritime industry expire in June; and those in the postal and West Coast longshore industries, in July.

We do not know, of course, what economic conditions will exist at the time of the negotiations. But, as the Nation entered the fourth quarter of 1980, some indicators, such as gross national product, housing starts, and industrial production rebounded after declining in the first half of 1980.[2] The third quarter saw an increase in retail sales and a recovery in durable goods orders. Interest rates, although dropping from recent record levels, have remained high. Employment has remained relatively stable since the first of the year, but the unemployment rate rose to 7.7 percent by midyear (from 6.2 percent in January), and remained at about that rate until it inched down to 7.6 percent in August, and to 7.5 percent in September. Double-digit inflation continued through the first half of 1980. However, in the third quarter, the Consumer Price Index, which had risen at an 18.7-percent annual rate in the first quarter, slowed to a 7.0-percent rate.

The recent high rate of inflation may cause negotiators to focus on cost-of-living adjustment (COLA) clauses as a means of helping workers recoup lost purchasing power.[3] About 42 percent of the workers under major agreements that either expire or are subject to reopening in 1981 have COLA protection. In recent years, there has not been a substantial increase in the prevalence of COLA provisions in major agreements, but there has been a tendency to liberalize existing formulas.[4] Major contracts with COLA clauses have tended to provide for a larger total wage increase, as can be seen from the following tabulation, which shows the average annual wage change (in percent) of the expiring contracts:[5]

	Negotiated change	*Negotiated change plus COLA*
Contracts expiring in 1981 . .	6.9	8.1
With COLA	5.8	8.6
Without COLA	7.7	—

Railroads

Contracts expire on March 31, 1981, for 400,000 employees of the Nation's class 1 railroads (rail carriers with operating revenues of more than $50 million a year). Proposals for changes in the agreements will be exchanged no earlier than January 1. Representatives of 13 railroad unions will conduct coordinated bargaining sessions with the National Railway Labor Conference, the bargaining agent for most of the rail carriers. Three

---

David Schlein is an economist in the Office of Wages and Industrial Relations, Bureau of Labor Statistics.

organizations represent a majority of the workers—the United Transportation Union; Brotherhood of Maintenance of Way Employes; and the Brotherhood of Railway, Airline and Steamship Clerks, Freight Handlers, Express and Station Employees.[6]

The movement towards coordinated bargaining with common expiration dates began in 1973, when all of the major unions agreed to negotiate as a group with the conference. The parties are limited to negotiating on wages, cost-of-living adjustments, and health and welfare benefits. Issues specific to individual unions are considered in separate negotiations between each union and the conference.

In 1978, for the first time since it was formed in 1963, the conference did not represent all class 1 railroads, as Conrail and several bankrupt railroads bargained on their own.[7] It is possible that one or more of the major rail carriers will not be represented by the conference in 1981.

The last round of rail negotiations began in July 1977 and continued into the summer of 1979. The 39-month agreements, consummated by the various unions, generally provided for straight wage increases of 14 percent over the life of the contract;[8] two cost-of-living adjustments payable under the expired contracts; semiannual cost-of-living reviews, providing up to an 8-percent increase per year; improved vacation, medical, and dental benefits; and some changes in work rules intended to cut labor costs. The parties also agreed to refer the issue of the size of crews to local negotiations.

The 1978 round of bargaining was conducted without a work stoppage. Only one emergency board was established, as specified in the Railway Labor Act, to hear the dispute between the conference and the Train Dispatchers.[9] The board mediated a settlement within the required 30 days, the first such mediated agreement in a national railroad case.

Information on 1981 union demands is not now available. However, negotiations will undoubtedly be influenced by the industry's improved economic performance and the recent deregulation, which has spurred merger proposals and increased competition among the major rail carriers.

[1] Eleven agreements covering 23,000 workers are excluded because they have no fixed expiration or reopening date.

[2] These include 55 major agreements, covering 178,000 workers, which are due to expire between November 1 and December 31, 1980; and 273 agreements, covering 637,000 workers, which expired prior to November 1, but for which necessary information had not been fully gathered.

NOTE: Only bargaining units in the private nonagricultural economy affecting 1,000 workers or more are considered for this table. Because of rounding, sums of individual items may not equal totals.

Bituminous coal

The contract between the United Mine Workers of America (UMW, Ind.) and the Bituminous Coal Operators Association (BCOA), covering about 125,000 miners, mostly in the Appalachian region, expires March 26. Settlement terms for bituminous coal miners traditionally set the pattern for other agreements covering coal mine construction workers (14,000), western surface miners (12,000), and anthracite coal miners (2,000).

Before the discovery of vast western petroleum and natural gas fields, coal had been the primary energy source in the United States. After a long decline, annual coal production has risen steadily since 1961, spurred in recent years by soaring oil prices and intermittent shortages. However, a rapidly increasing proportion of coal production is coming from new western surface fields where the UMW is weak. During much of the 1970's, the Appalachian deep mines, where the union has its principal strength, have been plagued by overproduction and unemployment.

The 90 year-old UMW has been ridden by internal dissent, financial problems,[10] and competition of other unions for the miners in the prosperous western fields.[11] During the 1980's, however, continued oil price rises are likely to accelerate the demand for coal, and may help provide jobs for 20,000 UMW members now unemployed.[12]

The expiration of the UMW-BCOA agreement in December 1977 marked the start of a bitter 111-day strike. The first agreement, negotiated by UMW President Arnold Miller, was rejected by the union's bargaining council; a second agreement was rejected by the membership. In an attempt to get the miners back to work, President Jimmy Carter invoked the emergency dispute procedures of the Taft-Hartley Act, explaining that "at least a million more Americans will be unemployed if the walkout continues."[13]

A settlement, reached March 14, 1978, terminated the automatic cost-of-living adjustments but provided for an immediate $1-per-hour pay increase and additional 70-cent increases in 1979 and 1980. The miners also received increased shift differentials, additional vacation time, an improved health benefit program for employees and retirees, and an improved retirement plan. The coal operators were allowed to introduce production incentive plans, if approved by a majority of the union members at individual mines.[14]

Strikes have been a chronic problem in the coal mining industry; the last five rounds of national negotiations have been marked by walkouts. Such strikes can idle workers in other industries, particularly those in railroads and primary metals. Local and regional disputes, usually over noneconomic issues such as safety and mine administration, and often unauthorized by the UMW national leadership, occur more frequently in coal mining than in other industries. However, since the 1978 settlement, the incidence of "wildcat" strikes has declined by 90 percent, even though the BCOA did not secure the right to discipline the leaders of unauthorized strikes; hence, such walkouts may not be a major issue in the 1981 negotiations.

According to UMW sources, major union demands in 1981 include a substantial wage increase, an "uncapped" escalator clause, greater shift differentials and a shorter work week. The union is likely to seek additional safety measures (including full-time safety inspectors and nurses at each mine, and the right to stop work over unsafe conditions), an expedited arbitration procedure similar to that used in the primary metals industry, and placement of arbitrators under contract which would help to avoid delays and fee raising.

UMW President Sam Church has expressed optimism that negotiations will be peacefully concluded. Talks began in mid-September, although serious bargaining is not expected until early next year.

Postal Service

A national agreement covering 570,000 employees of the U.S. Postal Service is up for renewal July 20. Negotiating unions include the American Postal Workers Union, the National Association of Letter Carriers, the Mail Handlers' division of the Laborers' International Union of North America, and the National Rural Letter Carriers Association (Ind.).

Postal unions were primarily lobbying organizations until they gained some bargaining rights in the 1960's, but most economic and job security issues were decided by the Congress. Employee dissatisfaction led to a postal strike in 1970, followed by passage of the Postal Reorganization Act of 1970.[15] The act established the Postal Service as an independent agency, and authorized collective bargaining similar to that in private industry. Unions representing the majority of postal workers set up a coordinated bargaining committee to negotiate with postal officials.

Bargaining experience since 1970 has varied. The 1971 talks lasted 6 months and were marked by acrimony, deadlocks, and factfinding intervention. Negotiations in 1973 went fairly smooth, but the 1975 settlement required mediation, and 1978 negotiations were submitted to arbitration. Negotiations at the national level have been aggravated by intermittent postal budget deficits; declining employment resulting from automation and private competition; the differing impact of inflation and automation on local postal facilities; and varying interpretations of the agreements at the local level.

The initial agreement of the 1978 negotiations was ratified by the National Rural Letter Carriers but rejected by members of the other three unions. Further bargaining was unsuccessful, and an arbitrator decided the terms in dispute, awarding the workers an annual pay increase of $500, a 3-percent increase after 1 year, and $500 after 2 years; an "uncapped" escalator clause; and continuation of the job security clause, introduced in 1971. (The wage terms were similar to those awarded members of the National Rural Letter Carriers.) The arbitrator ruled that regular employees on payroll as of September 1, 1978, were protected from layoff "during their worklife" and that employees hired later would gain the same protection after 6 years of qualifying service.

The postal talks are scheduled to start in early 1981 and are anticipated to be difficult. It has been mentioned that the unions will abandon coalition bargaining, meaning that Postal Service management will have to conduct separate negotiations with each national union. Management, under pressure to cut labor costs, may seek to roll back union gains won in previous rounds, particularly the "uncapped" COLA clause, and the "worklife" protection of employees from layoff. The unions almost certainly will resist such efforts, and additionally, may seek new gains, such as greater safety protection for employees working with automated mail

Table 2. Major contract expiration and wage reopening dates, by industry

[1] Eleven agreements covering 23,000 workers are excluded because they have no fixed expiration or reopening date.

[2] These include 55 major agreements, covering 178,000 workers, which are due to expire between November 1 and December 31, 1980; and 273 agreements, covering 637,000 workers, which expired prior to November 1, but for which necessary information had not been fully gathered.

NOTE: Only bargaining units in the private nonagricultural economy affecting 1,000 workers or more are considered for this table. Because of rounding, sums of individual items may not equal totals.

processing equipment. Although strikes against the Federal Government carry stiff penalties, such action is possible. Delegates to recent Letter Carriers' and Postal Workers' conventions adopted "no contract, no work" mandates, and the Postal Workers' union has a new president, Morris Biller, who, reportedly, is more militant than his predecessor, Emmet Andrews.

West Coast longshoring

On July 1, 1981, the 3-year agreement between the International Longshoremen's and Warehousemen's Union (Ind.) and the Pacific Maritime Association is due to expire. Although the agreement covers only about 11,500 workers, it involves virtually all firms engaged in longshoring operations at West Coast ports. Interruption of such operations can quickly affect shipping, trucking, railroads, and eventually can spread to other industries.

Until the 1950's (except during World War II), West Coast dock negotiations usually were marked by impasses and strikes, and at times by violence.[16] With the advent of the Pacific Maritime Association in 1949, labor-management relations gradually improved. The Mechanization and Modernization Agreement of 1959,

(Text continued on p. 29)

[1] Geographical coverage of contracts is interstate unless specified.

[2] Unions are affiliated with AFL - CIO, except where noted as independent (Ind.).

[3] Contract term refers to the date contract is to go into effect, not the date of signing. Where a contract has been amended or modified and the original termination date extended, the effective date of the changes becomes the new effective date of the agreement. For purposes of this listing, the expiration is the formal termination date established by the agreement. In general, it is the earliest date on which termination of the contract could be effective, except for special provisions for termination as in the case of disagreement arising out of wage reopening. Many agreements provide for automatic renewal at the expiration date unless notice of termination is given. The Labor Management Relations Act of 1947 requires that a party to an agreement desiring to terminate or modify it shall serve written notice upon the other party 60 days prior to the expiration date.

[4] Dates shown indicate the month in which adjustment is to be made, not the month of the Consumer Price Index on which adjustment is based.

[5] Hourly rate increase unless otherwise specified.

[6] Contract terms are not on file with the Bureau of Labor Statistics; information is based on newspaper accounts.

which allowed companies to introduce labor-saving technology to the docks in exchange for guarantees of employee income, is considered a major innovation in labor relations. However, the only significant coastwide strike since the 1940's centered on a labor-saving technology—cargo containerization. The walkout began July 1, 1971, and ended February 21, 1972, although it was temporarily halted by a Taft-Hartley injunction and by an agreement to resume work for a limited period. Workers at Eastern and Gulf Coast ports joined in the strike, making it the first nationwide longshore strike in U.S. history.

The terms of the 1978 settlement provided for an 85-cent-per-hour increase in each of the 3 years, greater skill differentials, added holidays, a sixth week of vacation at 25 years of service, and improved medical, life insurance, and retirement benefits. The association agreed to the concept of seniority in the selection of "steady men" (highly-skilled employees who work almost exclusively for a single employer), as well as a fair distribution of work and training opportunities for such workers. The 1978 agreement included, for the first time, a union security clause, requiring all fully-registered employees to become union members within 30 days.

The Longshoremen's union formulates contract demands at a biennial caucus of representatives from its locals. Major objectives in the 1981 talks have not been announced, but job security is likely to continue as a significant issue for the union.

Maritime industry

In June, 3-year agreements covering 50,000 seamen in dry cargo and tanker operations will expire. The four unions involved are AFL-CIO affiliated—the National Maritime Union, the Seafarer's International Union, the Marine Engineers' Beneficial Association, and the Masters, Mates and Pilots of the International Longshoremen's Association.

The bargaining structure in shipping is relatively complex. Most licensed officers are represented primarily by four nationwide labor organizations that have separate bargaining units on each coast—the Marine Engineers' Beneficial Association; International Organization of Masters, Mates and Pilots; American Radio Association; and Radio Officers' Union. In addition, three small coastal unions also represent licensed officers. On the East and Gulf Coasts, two rival unions—the National Maritime Union and the Atlantic, Gulf, Lakes and Inland Waters District of the Seafarers' International Union—represent deck, engine, and steward department seamen. On the Great Lakes, these two rival unions negotiate for most of the unlicensed seamen. On the West Coast, unlicensed seamen in deck, engine and steward departments are represented by the Pacific District of the Seafarers' International Union.

Several associations negotiate with the unions, depending on geographic area. On the East and Gulf Coasts, two committees conduct negotiations. The Maritime Service Committee bargains for subsidized passenger and dry cargo ship operators, and the Tanker Service Committee bargains for tanker companies. Both committees negotiate with the National Maritime Union and all of the East Coast licensed officers' organizations. Shipping operators who are not eligible for Government subsidies are represented by the American Maritime Association. This association negotiates with the Seafarers' International Union and the unions of licensed officers. The two committees and the association are not empowered to bind its members to the terms of the contract; instead, each operator member concurring in the agreement signs an individual contract with the unions. If a member disagrees with the terms, it negotiates its own pact with the union involved.

On the West Coast, the Pacific Maritime Association, which represents many steamship companies, negotiates with the Seafarers' International Union and the West Coast licensed officers' unions. The tanker companies, which do not belong to the association, bargain separately with the West Coast unions. In addition, several large companies, such as Exxon Corp. and Mobil Oil, conduct separate negotiations with independent labor associations.

Despite heavy subsidies enjoyed by some U.S. companies engaged in foreign trade, the U.S. merchant marine has suffered a marked decline since World War II and presently accounts for only a small percentage of the vessels engaged in U.S. foreign trade. Employment in the industry has suffered from competition from foreign vessels, alternative modes of transportation, automation, and containerization of cargo. Efforts to revitalize the industry, particularly a dwindling fleet, are being made under the Omnibus Maritime Bill, which would set a goal for the 1980's of transporting 50 percent of this country's exports and imports in U.S. ships. The bill is now pending in the Congress.

Unions have not yet announced 1981 demands. Important items of discussion are likely to be wages, improved vacation and health and medical benefits, and retiree protection against inflation.

Airlines

Contracts held by unions representing employees of trunk line carriers will be up for renewal throughout 1981.[17] The large number of contracts reflects the collective bargaining structure in the industry. Like the railroads, the airlines' collective bargaining relations are governed by the Railway Labor Act. Unlike the railroads, each carrier generally bargains separately with each craft. Most airline workers are organized on a craft basis, with each craft represented in a separate bargaining unit and, frequently, by a different union.

Of the various crafts or classes, only the mechanics, pilots, and flight attendants will be heavily involved in 1981 negotiations. The Air Line Pilots Association will bargain throughout the year for 21,000 pilots at Braniff, Continental, Delta, Eastern, Trans World, United, and Western. The Allied Pilots Associations's (Ind.) contract at American, covering 3,300 pilots, expires November 1.

Contrary to other airline unions, the International Association of Machinists and Aerospace Workers (Machinists), which bargains for most of the industry's unionized ground service employees, has a common contract expiration date with several of the larger carriers. Contracts covering approximately 52,000 mechanics and related employees represented by the Machinists will terminate at Braniff, Northwest, Trans World, and

United on November 1, and at Eastern on December 31.[18] The only other mechanic unit bargaining in 1981 is at Western, where the International Brotherhood of Teamsters, Chauffeurs, Warehousemen and Helpers of America (Teamsters, Ind.) will negotiate for 1,800 mechanics, whose contract expires January 1.

Unlike the pilots and mechanics, the flight attendants are represented by various labor organizations. Northwest's contract covering 2,200 members of the Teamsters union terminates on January 1. The Independent Union of Flight Attendants' contract for 5,200 employees at Pan American comes up for renewal on May 1. The 5,600-member International Federation of Flight Attendants' contract at Trans World terminates on August 1, and the Association of Flight Attendants, an affiliate of the Air Line Pilots Association, will renegotiate for 2,000 employees at Braniff in January.

Unlike the last major round of negotiations, bargaining in 1981 will take place in a more uncertain economic environment, as the industry is experiencing the competitive effects of deregulation and sagging profits, and layoffs as a result of mergers and a sluggish economy. The unions' bargaining goals are still being formulated, but it is likely that the mechanics units will concentrate on job protection, wage issues, and improvements in pension benefits and cost-of-living adjustments. Notwithstanding potential money demands, the crew size issue should be a major one for the pilots, with the impending introduction of the new B-757 and B-767 aircraft. If history repeats itself, flight attendant groups will probably propose numerous changes involving all major contract provisions. □

—— FOOTNOTES ——

[1] Major agreements are those that cover 1,000 workers or more. The Postal Service is not included in the 2.6 million workers covered by major expiring contracts.

[2] The economy entered a recession in January 1980; some economists have argued that this downturn ended in July or August.

[3] For more detailed information about escalators offsetting inflation, see Victor Sheifer, "Cost-of-living adjustment: keeping up with inflation?" *Monthly Labor Review*, June 1979, pp. 14–17.

[4] For an analysis of how 1979 contracts compared with prior contracts see Edward J. Wasilewski, "Inflation again outpaces wage and package gains in 1979," *Current Wage Developments*, July 1980, pp. 41–60.

[5] Data are through October 1980. Thus, additional COLA amounts may be added until the contracts expire in 1981.

[6] The 10 other unions participating in the negotiations are the American Train Dispatchers Association; Brotherhood of Locomotive Engineers (Ind.); International Association of Machinists and Aerospace Workers; Railroad Yardmasters of America; Sheet Metal Workers International Association; Brotherhood of Railroad Signalmen; International Brotherhood of Firemen and Oilers; International Brotherhood of Electrical Workers; Brotherhood of Railway Carmen of the United States and Canada; and International Brotherhood of Boilermakers, Iron Ship Builders, Blacksmiths, Forgers and Helpers. This increase in unions represented at the bargaining table reflects the dissolution of the Railway Employees' Department, which bargained for four of six shop craft unions in the 1978 negotiations.

[7] Amtrak, a class 1 carrier, has never been represented by the conference in negotiations.

[8] See *The New York Times*, July 15, 1978, p. 1.

[9] Collective bargaining in the railroad industry is governed by the Railway Labor Act which provides an elaborate set of dispute settlement procedures. The party wishing to reopen the contract must give the other party 30 days' notice of such intent, within which time negotiations must begin. If an agreement is not reached, either or both parties may request the assistance of the National Mediation Board, the agency that administers the act; or the board itself may proffer its services. If mediation fails to bring about a settlement, the board proffers arbitration. If arbitration is rejected, the board terminates its services, and a 30-day status quo period begins. If the dispute remains unresolved and is of a sufficient magnitude, the President may create an ad hoc emergency board to investigate and make a report within 30 days. During this period and for 30 days thereafter, strikes and changes in employee working conditions are prohibited.

[10] In 1972, Arnold Miller defeated W. A. "Tony" Boyle for president of the UMW. Miller was unable to control pro-Boyle and other factions, dropped many reforms, and alienated many of his supporters. In ill health, he stepped down in 1979 and was succeeded by then union vice president Sam Church. The union's financial problems are discussed briefly in Mary A. Andrews, "Mine Workers' new president wins dues increase, right to name VP," *Monthly Labor Review*, March 1980, pp. 48–50.

[11] The International Union of Operating Engineers and the International Brotherhood of Electrical Workers, both AFL-CIO affiliates, have actively organized western miners. The Progressive Mine Workers and the Southern Labor Union, independents, have membership in the Midwest and South. A minority of coal miners work in unorganized mines.

[12] See Harold Wool, "Coal industry resurgence attracts a variety of new workers," *Monthly Labor Review*, forthcoming.

[13] See "Developments in Industrial Relations," *Monthly Labor Review*, April 1978, pp. 55–56.

[14] See "Developments in Industrial Relations," *Monthly Labor Review*, May 1978, pp. 69–70.

[15] At its peak, the strike disrupted the processing and delivery of mail in 15 States and numerous cities. Federal troops were called in to maintain service in some areas. Since 1970, work stoppages have been minor. See Stephen C. Shannon, "Work stoppage in Government: the postal strike of 1970," *Monthly Labor Review*, July 1978, pp. 14–22.

[16] Pacific Coast dockworkers still observe "Bloody Thursday" as a holiday to commemorate July 5, 1934, when two strikers were killed and many were injured by police. At the time, the workers were represented by the International Longshoremen's Association.

[17] Trunk line air carriers include American Airlines, Braniff International, Continental Airlines, Delta Air Lines, Eastern Air Lines, Northwest Airlines, Pan American World Airways, Trans World Airlines, United Air Lines, and Western Airlines.

[18] Besides the mechanics, the Machinists bargains for stock and stores and flight kitchen employees at Eastern and Northwest; stock and stores, flight kitchen employees, and guards at Trans World; and communications, fleet service, stock and stores, flight kitchen employees, and dispatchers at United.

International comparisons of productivity and labor costs

As in the United States, manufacturing productivity growth slowed after 1973 and unit labor costs accelerated in most major industrial countries; aggregate hours rose only in the U.S.

ARTHUR NEEF AND PATRICIA CAPDEVIELLE

In the United States, the average annual rate of growth of manufacturing productivity after 1973 (1.4 percent) was less than half that from 1960 to 1973 (3.1 percent). Manufacturing productivity growth also slowed in the 10 other industrial countries studied, but the magnitude of the slowdown varied—from more than 85 percent in the United Kingdom to only about 15 percent in France and Belgium and less than 5 percent in Germany.

This article describes developments in manufacturing productivity (output per hour), hourly compensation, and unit labor costs from 1973 to 1979 for the United States, Canada, Japan, France, Germany, Italy, the United Kingdom, and four smaller European countries—Belgium, Denmark, the Netherlands, and Sweden.[1,2]

In all 11 countries, the average rate of growth of manufacturing output decelerated after 1973. In the European countries and Japan, the output slowdown was greater than that of manufacturing productivity, reflecting declines in labor input. From 1973 to 1979, overall, aggregate hours of manufacturing employees rose only in the United States, and manufacturing employment increased only in the United States, Canada, and Italy.

Manufacturing unit labor costs in the United States accelerated four-fold from less than 2 percent per year during 1960–73 to about 8 percent per year from 1973 to 1979, because of significantly larger annual gains in hourly compensation in conjunction with the productivity slowdown. For like reasons, 7 of the 10 foreign countries also experienced sharply higher rates of increase in unit labor costs after 1973. The exceptions were: Germany, where annual gains in both productivity and hourly compensation were similar in the two periods, and Japan and the Netherlands, where average annual increases in hourly compensation were smaller in 1973–79 than in the pre-1974 period. Measured in U.S. dollars, however, even these three countries had significantly higher average annual increases in unit labor costs during 1973–79.

Although the productivity measure relates output to the hours of persons employed in manufacturing, it does not measure the specific contributions of labor as a single factor of production. Rather, it reflects the joint effects of many influences, including new technology,

capital investment, the level of output, capacity utilization, energy use, and managerial skills, as well as skills and efforts of the work force.

Productivity and output slow

From 1973 to 1979, manufacturing productivity, as measured by output per hour, increased at annual rates of 1.4 percent in the United States, .5 percent in the United Kingdom, 2 to 2.5 percent in Canada and Sweden, 4 to 6 percent in the other European countries, and 7 percent in Japan. In contrast, the average annual rates of growth of manufacturing productivity from 1960 to 1973 were about 3 percent in the United States, 4 to 4.5 percent in the United Kingdom and Canada, 5.5 to 7.5 percent in the continental European countries, and more than 10 percent in Japan. (See table 1.)

In the United States, 1973 was the year of a business cycle peak, and in the other countries economic activity peaked in that year or the first half of 1974. The recession which followed in 1974–75 was on average the steepest economic decline in the last 30 years and, for most countries, the productivity trend during the recession and recovery was markedly weaker than in previous periods.

The slowdown in productivity, as measured by the difference in growth rates between the two periods, was greatest in Sweden (minus nearly 4.5 percentage points), followed by Italy, Japan, and the United Kingdom (minus 3.5 points). However, in proportion to the average rate prior to 1974, the slowdown was by far the greatest in the United Kingdom, where the productivity growth rate for 1973–79 was less than 15 percent of the 1960–73 average rate, followed by Sweden, the United States, Canada, and Italy—about 35 to 50 percent of the 1960–73 average rate. According to either measure, the productivity slowdown was modest in France and Belgium, and growth in the two periods was almost unchanged in Germany.

During the 1974–75 recession, output per hour declined or rose significantly less than the average trend in most countries. Only in Germany and Denmark were the average productivity gains over the 2 years close to their long-term rates. After large advances during the post-recession recovery, annual productivity increases have generally been below average 1960–73 rates. The major exception was Italy, which achieved a productivity gain of 9.5 percent in 1979.

Manufacturing output dropped sharply in most countries during the recession. The largest declines occurred in the United States, Italy, and the United Kingdom, and the smallest in France. Output posted a strong recovery in 1976 in most countries, but subsequent growth has been sluggish—particularly in most of the European countries. From 1973 to 1979 overall, manufacturing output declined slightly in the United Kingdom and remained virtually unchanged in Sweden. Output increased at annual rates of around 1 to 3 percent in the other European countries, the United States, and Canada, while it increased more than 5 percent per year in Japan.

Employment and hours decline

In 6 of the 8 European countries, the 1973–79 productivity gains largely reflected significant decreases in

[1] Average annual compound rate of change.

[2] Excluding manufacturing handicrafts.

labor input—the aggregate hours of manufacturing employees. Declines in hours accounted for 90 percent of the productivity rise in Sweden, for 60 to 75 percent in Belgium, Netherlands, and Germany, and for 40 to 50 percent in Denmark and France. In Italy, however, falling hours accounted for less than 15 percent of the productivity increase. The small British productivity gain reflected an overall decline in hours somewhat greater than the decrease in output. In Japan, declines in labor input accounted for 20 percent of the gain in productivity. In contrast, aggregate hours rose in the United States.

Productivity gains during 1960–73 were not as dependent on falling hours. Hours declined overall in most of the European countries, but accounted for no more than one-fourth of any country's productivity rise.

From 1973 to 1979, aggregate hours of manufacturing employees declined 3 to 4 percent per year in Germany, Belgium, and the Netherlands; 1 to 2 percent in France, Denmark, Sweden, the United Kingdom, and Japan; and .5 percent in Italy. Hours were unchanged in Canada and increased about .5 percent per year in the United States. In the latter three countries, manufacturing employment increased over the 6-year period. Total hours remained unchanged in Canada and fell in Italy because of reductions in average hours. In most other countries, the decreases in aggregate hours were attributable mostly to declines in employment, with the largest employment losses occurring in Belgium, the Netherlands, Denmark, and Germany. However, average hours also fell significantly in France, Germany, Belgium, the Netherlands, and Sweden, in part because the standard workweek was shortened or annual vacations increased. (See table 2.)

During the 1974–75 recession, total hours declined as much as 15 percent—the largest decreases occurring in the United States, Japan, Germany, Belgium, and Denmark. In the United States and Denmark, employment losses accounted for most of the decline, while in Japan and several European countries, short-time work programs were used more extensively to adjust total hours. Total hours regained 1973 levels in 1978 in the United States and in 1979 in Canada. In Japan and most European countries, employment and hours continued to

fall, as manufacturing employment was rationalized and working hours shortened. In most European countries, this process had begun before the recession, but the rate of decline was more rapid after 1973.

Hourly compensation gains

From 1973 to 1979, hourly compensation in manufacturing increased at annual rates of 9 to 11 percent in the United States, Germany, and the Netherlands; around 13 percent in Canada, Japan, Belgium, and Denmark; 15 percent in France and Sweden; 19 percent in the United Kingdom; and 21 percent in Italy. For the United States and Canada, these increases were about double the average compensation gains made in 1960–73; in the United Kingdom, more than double; and in France, Italy, and Sweden, they were approximately 50 percent higher. On the other hand, in Belgium and Denmark, 1973–79 annual rates of growth were not much higher than those for the previous period; and in Japan, Germany, and the Netherlands, they were about the same or lower. (See table 3.)

Hourly compensation increases peaked at around 30 percent in Japan, Italy, and the United Kingdom and at about 20 percent in France and the four smaller European countries in 1974 or 1975. U.S. annual compensation gains peaked at 12 percent in 1975, and in Canada and Germany, the high was 15 percent in 1974. By 1978 or 1979, compensation increases had moderated considerably in most of the countries. It was greatest in Japan where increases for 1978 and 1979 were only about 6 percent, one-fifth of the 1974 increase. Compensation gains also slowed significantly in Belgium, Germany, the Netherlands, Sweden, and the United Kingdom. (In the United Kingdom, however, the smallest annual increase occurred in 1977, and by 1979 the rate of growth was up again to 17 percent.) By comparison, hourly compensation increases diminished much less in Canada, France, Italy, and especially in the United States, and were higher in 1979 than 1978.

Unit labor costs accelerate

National currency basis. From 1973 to 1979, unit labor costs increased at average annual rates of about 8 percent in the United States, 7 percent in Belgium, 9 to 12 percent in Canada, France, Denmark, and Sweden, and 17 to 19 percent in Italy and the United Kingdom, but

only 4.5 percent in Germany and 5.5 percent in Japan and the Netherlands. These growth rates were 2 to 7 times higher than the average rates of increase from 1960 to 1973, except in Germany, Japan, and the Netherlands. (See table 3.)

For the United Kingdom and Italy, the higher rates of increase in unit labor costs after 1973 mostly reflected larger hourly compensation gains. This accounted for 70 to 75 percent of the change in their unit labor cost growth rates, and the productivity slowdown for only 25 to 30 percent. Also, for the United States, Canada, France, and Belgium larger gains in hourly compensation rather than the magnitude of the productivity slowdown accounted for most of the larger increases in unit labor costs. However, for Denmark and Sweden the slowdown in productivity contributed a greater proportion—50 to 60 percent.

In Germany, unit labor costs in manufacturing increased at practically the same rate both before and after 1973 because output per hour and hourly compensation both increased in line during the two periods. In the Netherlands, unit labor costs rose at nearly identical rates in the two periods because hourly compensation and productivity slowed at a like rate. In Japan, moderation in compensation gains offset most productivity slowdown.

The magnitude of the difference in the average annual rate of growth of unit labor costs in each country is

Table 4. Indexes of manufacturing output per hour, hourly compensation, unit labor costs, and related data, 1970–79

shown in the following tabulation, with the relative acceleration measured according to both proportion of the pre-1974 growth rate and percentage-point difference:

	Ratio: 1973–79 to 1960–73	*Percentage-point difference*
Canada	6.7	8.5
United States	4.4	6.1
United Kingdom . .	4.2	14.2
Sweden	3.6	8.8
Italy	2.9	11.0
France	2.8	6.7
Denmark	2.0	4.5
Belgium	1.9	3.4
Japan	1.3	1.1
Netherlands	1.1	.4
Germany	1.0	.1

The acceleration in the average rate of growth of unit labor costs was greatest in the United Kingdom and Italy, when measured in terms of percentage points. However, in proportion to the average rate before 1974, the increase was most rapid in Canada. The countries with little acceleration were the same—Germany, the Netherlands, and Japan—according to both methods of measurement.

During the 1974–75 recession, unit labor cost increases peaked at annual rates of nearly 9 percent in Germany, 15 to 18 percent in the United States, Canada, France, Belgium, Denmark, and the Netherlands, about 25 percent in Japan and Sweden, and 35 percent in Italy and the United Kingdom. With the post-recession recovery and moderation in hourly compensation gains in 1976 and 1977, manufacturing unit labor costs either declined or the increases diminished significantly. In 1979, costs fell or rose only about 1 percent in Japan, Germany, and Sweden; but in all of the other countries except Belgium and the Netherlands, they were still rising or had accelerated to much higher rates—more than 8 percent—than in the pre-1974 period.

In terms of U.S. dollars. When measured in U.S. currency, with relative changes in foreign exchange rates taken into account, unit labor costs increased at annual rates of about 9.5 percent in Japan, 10 to 13 percent in the continental European countries, and 16 percent in the United Kingdom from 1973 to 1979, compared with 8 percent in the United States and 7 percent in Canada. (See table 3.)

[1] Excluding manufacturing handicrafts.

The overall effects of the exchange rate movements during this period were to offset Italy's annual rate of growth of unit labor costs in national currency by nearly 6 percentage points, those in Canada and the United Kingdom by nearly 3 points. On the other hand, changes in the value of their currencies added 5 to 7 percentage points to the annual growth of unit labor costs for Germany, Belgium, and the Netherlands, about 4 points for Japan, 2.5 for Denmark, and less than 1 for France and Sweden.

Exchange rate movements were irregular during the 1973–79 period, with one or more large increases or declines in the currencies of each country. (See table 4.) The more significant movements were the depreciations of the British and Italian currencies versus the dollar in 1976 (down 19 and 21 percent, respectively) and the 1978 appreciations of the currencies of Japan (up 29 percent), Germany (16 percent), Belgium (14 percent), and the Netherlands (14 percent). Even France and Sweden, which had little overall exchange rate shifts, experienced significant currency value changes in specific years. ☐

FOOTNOTES

[1] Percent changes in productivity, labor costs, and other related measures for selected periods and each year from 1973 are shown in tables 1 to 3. Annual indexes for 1970 to 1979 are shown in table 4; those from 1950 are available upon request. Data sources are summarized in the appendix.

[2] See Keith Daly and Arthur Neef, "Productivity and unit labor costs in 11 industrial countries, 1977," *Monthly Labor Review*, November 1978, pp. 11–17; and "International Comparisons of Manufacturing Productivity and Labor Costs: 1978," Summary 80–1, February 1980.

APPENDIX: Data Sources

Output per hour, hourly compensation, and unit labor costs are compiled from basic series on manufacturing output, employment, average hours, and compensation. The latter three relate to all employed including self-employed persons in the United States and Canada and all employees in the other countries. Hours refer to hours paid in the United States, hours worked in the other countries.

In general, the measures relate to total manufacturing. However, manufacturing handicrafts are excluded from all basic series for Denmark (see below) and from the employment and hours measures for Germany. Handicraft workers in Germany account for nearly 17 percent of manufacturing employment, but preliminary BLS calculations indicate that their inclusion would have little effect on the average trend over time.

The output measures are gross product originating in manufacturing in constant prices from the national accounts of each country—except those for Japan for 1950 to 1970 and the Netherlands for 1969 to 1979, which are indexes of industrial production. (For Canada and the United Kingdom, the index of industrial production is identical to the national accounts measure of manufacturing output at constant prices.) The production index for Japan excludes about 6 percent of manufacturing value added; national accounts real output measures are not yet available for years before 1970. For the Netherlands, a production index is used in order to eliminate gas extraction from the manufacturing sector; the national accounts output data for recent years include gas extraction in manufacturing, which would distort the Dutch productivity series.

Appendix table 1. Comparative rates of change in output, output per hour, and unit labor costs, 1970–1978

Period	Output		Output per hour		Unit labor costs	
	National accounts	Production index	National accounts	Production index	National accounts	Production index
1970–78[1]	6.4	3.6	7.3	4.6	7.6	10.4
1973–78[1]	4.7	1.0	6.6	2.9	7.0	10.9
1970–71	4.2	2.7	4.3	2.8	10.7	12.3
1971–72	9.1	7.4	9.9	8.1	5.1	6.7
1972–73	15.1	15.9	11.5	12.2	10.4	9.7
1973–74	–.4	–3.8	4.1	.4	26.2	30.9
1974–75	–3.8	–11.0	4.0	–3.8	12.5	21.6
1975–76	13.3	11.2	9.4	7.4	–2.0	–.1
1976–77	9.0	4.0	8.8	3.9	1.3	6.1
1977–78	6.3	6.3	6.8	6.8	–.5	–.5

[1] Average annual compound rate of change.

The compensation measures are also from national accounts—except those for Belgium and for France for 1967 to 1979, which are BLS estimates. Compensation is defined as all payments made by employers directly to their employees, before deductions of any kind, plus employer contributions to legally required insurance programs and contractual and private welfare plans for the benefit of employees. Labor costs include, in addition to compensation, employer expenditures for recruitment and training; the cost of cafeterias, medical facilities, and various other plant facilities and services; and taxes (other than social security taxes, which are part of compensation) that are levied on payrolls or employment rolls. Annual data are not available for total labor costs. Labor costs, as used in this article, approximate more closely the concept of compensation. However, compensation has been adjusted to include all significant changes in taxes that are regarded as labor costs, and the omitted items represent no more than 4 percent of total labor costs in any country. Self-employed workers are included in the U.S. and Canadian figures by assuming that their hourly compensation is equal to the average for wage and salary employees.

The employment data are official estimates published with the national accounts or other comprehensive employment series; average hours are either from official aggregate hours series or BLS estimates of hours worked. For Belgium, France, and the Netherlands, the hours worked estimates may not reflect all random hours changes, such as time lost because of industrial disputes.

For all countries, preliminary estimates for recent years are generally based on current indicators of manufacturing output, employment and hours, and hourly compensation until national accounts and other statistics used for the long-term measures become available. Furthermore, national accounts statistics for the most current years are subject to revision as more information is received.

To compute the series for 8 European countries and 10 foreign countries, the data have been combined by aggregating the output, compensation, and hours figures for each year, adjusting where necessary for compatibility of coverage and concept. The average exchange rates for 1974–79 are used to aggregate the output and compensation data. The use of average 1974–79 exchange rates, however, does not imply that these rates reflect the comparative real value of currencies for manufacturing output. Also, the use of exchange rates for a different time period would have little effect on the combined indexes.

United States. The U.S. data in this article do not reflect a benchmark revision being made in the national income and product accounts incorporating the 1972 economic census and other new information. The current schedule calls for completion of the benchmark revision by this winter. All series will be revised back to at least 1967.

Japan. In this article, new national accounts constant price measures of gross product originating in manufacturing are introduced for Japan for the period 1970 to 1978. Previously, the index of industrial production was used as the manufacturing output measure for those years. For the years before 1970, the industrial production index will continue to be used until constant price measures of gross product originating become available.

The national accounts measure of gross product originating in manufacturing shows a much smaller decline in output during the 1974–75 recession and larger gains in most other years than does the production index. Appendix table 1 shows comparative rates of change in output, output per hour, and unit labor costs based on the two output series. Gross product originating in constant prices provides a measure of changes in value added—or gross output minus inputs of materials, fuels, and purchased services—while the index of industrial production for Japan measures base year value added extrapolated using quantity indicators of gross output only. According to the Japanese Economic Planning Agency, which produces the national accounts, their measure better reflects the structural changes which have occurred in Japanese manfacturing since the 1973 oil shock.

Denmark. Manufacturing establishments classified as handicrafts are not covered by the series for Denmark because relevant data by industrial sector are not available. The output and compensation figures used to construct the Danish productivity and labor cost measures are from the Danish national accounts, while the employment and hours figures are from an establishment survey. The Danish national accounts are currently undergoing a major revision, including the classification of handicrafts by industrial sector and the development of consistent data on employment. However, revised data are now available only for the period 1966–73. These figures indicate a significantly slower rate of productivity growth and, consequently, a larger increase in unit labor costs for that period. The following are average annual rates of change for 1966–73 based on the revised data, with the presently used data in parentheses: Output per hour, 6.9 percent (8.4); hourly compensation, 13.3 percent (12.3); and unit labor costs, 6.0 percent (3.6). BLS does not know how much of the change is the result of including handicrafts, because the revisions also include a new system of industrial classification, new statistical data, and revised methods of calculation.

Labor requirements decline for public housing construction

Onsite and offsite spending in 1979 created about 28,200 jobs for each $1 billion, including about 11,700 in other industries; turnkey projects, born during the 1960's, have accelerated declines in onsite employee-hour requirements

ROBERT J. PRIER

Each $1 billion of expenditure for public housing construction during 1979 generated an estimated equivalent of 16,500 full-time jobs in the construction industry, 13,800 onsite and 2,700 offsite, according to a Bureau of Labor Statistics survey.[1] The Bureau also estimates that for each $1 billion spent during 1979 about 11,700 jobs were generated in other industries: 6,000 in manufacturing; 4,400 in trade, transportation, and services; and 1,300 in mining and other industries. For each $1,000 (constant 1960) spent during 1979, 23 worker hours were generated in other industries: 12 in manufacturing; 8 in trade, services, and transportation; and 3 in mining and other industries.

Data from the survey, which covered public housing projects completed in 1975, indicate that labor requirements for public housing construction have decreased.[2] The number of employee hours generated in the construction industry for each 1,000 constant dollars of contract cost fell from 128.3 in 1960, to 99.4 in 1968, to 76.5 in 1975. For onsite work (activity performed at the construction site) the respective figures for the 3 years were 113.7, 87.6, and 62.7. (See table 1.)

The average annual rate of decline in onsite employee-hour requirements has accelerated in recent years largely because of a shift in the types of projects. In constant dollars, the number of onsite employee hours per $1,000 decreased at an average rate of 3.9 percent per year during 1960–75. The rate was 3.2 percent per year during 1960–68, but advanced to 4.7 percent during 1968–75. This trend reflects the inclusion of turnkey projects in the 1975 survey and the increasing use of prefabricated components, more efficient building methods, and more productive onsite workers.

The current survey represents the first time that turnkey projects have been included in the sampling universe. These projects, built and completed by private contractors, and then turned over to local housing authorities, are an important component of public housing construction in the United States today. Because turnkey projects were not started until the late 1960's, and were not a factor in public housing construction until the 1970's, the 1960 and 1968 surveys dealt with conventional projects only; that is, projects built under the direct supervision of local housing authorities. To present data representative of all public housing, both conventional and turnkey projects will be included in future surveys of public housing construction. It is estimated that turnkey projects currently account for two-thirds of public housing construction. This proportion will probably not change significantly in the near future.

Onsite labor requirements

For both turnkey and conventional public housing projects surveyed in 1975, 62.7 employee hours were generated at the construction site for each 1,000 constant dollars of expenditure. Onsite employment requirements declined at an average rate of 4.7 percent a year during 1968–75, a significant portion of which can

---

Robert J. Prier is an economist formerly in the Office of Productivity and Technology, Bureau of Labor Statistics.

be attributed to the presence of turnkey projects.

By project type. Turnkey projects require substantially fewer employee hours than do conventional ones, 27.4 employee hours per $1,000 of contract cost, while conventional projects required 41.1. For both types of projects completed in 1975, 33.2 employee hours were generated at the construction site for each $1,000 of construction expenditure. (See table 2.)

For conventional projects only, the rate of decline in onsite employee-hour requirements was considerably lower than that for all public housing construction. Between 1968 and 1975, the number of employee hours required by each $1,000 of cost declined from 87.6 to 77.6, an average annual rate of 1.7 percent. Because only a few turnkey projects were completed in 1968 (and were not included in the survey), a comparable figure for them is not available. However, when conventional projects completed in 1968 are compared with both kinds of projects for 1975, the average annual rate of decline for onsite employee hours was 4.7 percent.

By region. Public housing construction in the South required more labor than any other region. Construction wage rates generally are lower in the South where there is more unskilled labor, facilitating substitution of labor for capital. The North Central States had the lowest employee-hour requirements, 26.8, followed closely by the Northeast and Western regions.

Increases in costs of materials, equipment, and labor caused the average cost per square foot of public housing construction to rise from $15.22 in 1968, to $25.21 in 1975, representing an average increase of 7.5 percent a year. During the same period, the average cost per building unit rose from $12,300 to $21,700.

Projects in the Northeast region were the most expensive in 1975; the cost per square foot was $30.35, or 20 percent higher than the national average. The North Central and Western regions ranked second and third, respectively. Costs in the South were considerably lower partly because of lower wage rates and more unskilled labor. Costs per square foot were:

	All regions	*North-east*	*North Central*	*South*	*West*
All projects	$25.21	$30.35	$29.95	$20.98	$27.27
Conventional . . .	24.39	34.13	28.92	20.33	26.42
Turnkey	25.86	28.62	30.70	21.65	27.75

Table 1. Employee hours per $1,000 of construction cost for public housing construction, and projections for 1979, and rates of change, selected years

Year	Dollars	Total construction	Onsite	Offsite
1960	Current	128.3	113.7	14.6
1968	Current	90.3	79.6	10.7
	1960	99.4	87.6	11.8
1975	Current	40.5	33.2	7.3
	1960	76.5	62.7	13.8
1979[1]	Current	21.6	17.7	3.9
	1960	63.0	51.6	11.4
Average annual rates of change				
1960-75		-3.4	-3.9	-0.4
1960-68		-3.1	-3.2	-2.6
1960-75		-3.7	-4.7	+1.0

[1] Estimated, adjusted for productivity change of -4.7 percent a year.

During 1968-75, the average size of dwelling units rose from 811 to 859 square feet. (The figure for 1960 was 992.) Despite the increase, employee-hour requirements per dwelling unit have decreased from 983 hours in 1968 to 720 in 1975. (See table 3.)

By occupation. Onsite labor requirements by type of occupation, although not collected for the current survey, show gradual shifts over long periods. Based on data from previous surveys of public housing construction, in 1960 more than 61 percent of the onsite labor force consisted of skilled tradesworkers, and in 1968, about 64 percent. Carpenters accounted for the largest single share of employment in 1960 and 1968, with 19 and 20 percent, respectively; followed by plumbers at 8 and 9 percent; bricklayers at 8 percent for both years; electricians at 4 and 6 percent; and painters at 4 and 5 percent. Semiskilled and unskilled workers such as laborers, helpers, and tenders comprised between 30 and 31 percent of the onsite public housing construction work force in both studies. The remainder of onsite employees were in nonconstruction jobs such as supervisory, clerical, and custodial.

Contractors and subcontractors

In 1975, 37.6 percent of employee hours in public housing construction were supplied by general or prime contractors. The remainder was from subcontractors. General and prime contractors performed a larger share of work in the South and West, but subcontractors performed more work on projects in the Northeast and North Central regions. (See table 4.)

Of the structural types of buildings included in the 1975 public housing construction survey (high-rises, walk-ups, and townhouses and rowhouses), high-rise buildings of four or more stories required fewest employee hours. High-rise buildings generally require a larger percentage of materials and more intensive use of construction equipment. Also, high-rise construction is well-suited to take advantage of laborsaving prefabrication techniques.

Offsite labor requirements

In 1975, 18 percent of employee hours generated in the construction industry, by each $1,000 of expenditure for public housing construction, was worked away from the construction site. This includes employment such as in contractors' offices and warehouses.[3]

Onsite employment requirements have decreased at an average rate of 4.7 percent a year during 1968–75, while offsite employment has increased at 1.0 percent. This is partly because of the complexity and differing design standards of the various projects, resulting in an increase in support employment. Further, there is need for more clerical jobs because of increased recordkeeping, reporting, inventory, payrolls, and other requirements.

The greater use of preassembled components in areas such as kitchens, bathrooms, and closets also increases the amount of offsite labor and decreases that of onsite. This work is not affected by inclement weather, and individual mass-production techniques can be utilized in building the components, a major benefit. This trend is likely to continue as more laborsaving techniques are sought and as attempts are made to counterbalance the seasonal nature of the industry.

Some employment is generated indirectly from public housing construction. The production of needed materials and supplies creates jobs throughout the economy. Although materials data were not collected for this survey, extrapolation of trends from previous surveys were used to have developed data for 1975 and 1979. By applying material consumption data to a series of input-output matrixes, the Bureau has developed estimates for the indirect employment effects of public housing construction for each 1,000 current dollars of expenditure.[4]

Industry	*Current dollars*				*1960 dollars*			
	1960	*1968*	*1975*	*1979*	*1960*	*1968*	*1975*	*1979*
Total	109	66	34	23	109	73	63	67
Manufacturing	62	42	21	12	62	46	40	36
Trade, transportation, and services	29	16	8	8	29	18	15	22
Mining and miscellaneous	18	8	4	3	18	9	8	8

Distribution of costs

For projects completed in 1975, estimated expenditures for construction materials accounted for about 49 percent of contract costs.[5] Onsite labor accounted for nearly one-third of total costs. Equipment, overhead, and profit accounted for the remainder.[6]

The rising costs of construction materials and equipment during the 1970's are reflected in changing percent distributions of costs during the three survey years. General contractors do not have detailed cost information from their subcontractors, resulting in estimates only for 1975:

Type of cost	*1960*	*1968*	*1975*
Onsite wages	35.5	32.4	32.7
Materials	45.0	41.9	48.7
Equipment	2.5	1.5	4.4
Overhead and profit	17.0	24.2	14.2

Table 2. Onsite employee-hour requirements per $1,000 of contract cost for public housing construction, 1975

Characteristic	United States	Northeast	North Central	South	West

1968	90.5	1,216	1,033
1975	41.0	859	813
West			
1960	98.4	1,270	1,176
1968	62.8	949	741
1975	28.0	[illegible]	647

During 1968–75, the percentage of costs required by onsite wages and salaries remained about the same, but material and equipment expenditures increased. Labor's share of costs has decreased since 1960, indicating that productivity and technology changes have kept pace with wage increases during the survey period.

The dramatic decrease in overhead and profit during the period reflects, in part, that 1975 was a recession year for the industry. In the recession of 1974–75, contractors may have bid on less profitable jobs, or may have been willing to accept lower profits to stay in business and to keep core employees on payroll.

However, because the 1975 data are estimated by surveyed general contractors (actual costs can only be obtained directly from subcontractors), a definitive explanation of these changes cannot be made with the available data. ☐

Table 4. Percent distribution of employee-hour requirements for public housing construction, by type of operation and region, 1975

Type of operation	United States	Northeast	North Central	South	West
Total	100.0	100.0	100.0	100.0	100.0

FOOTNOTES

[1] The 1979 employment estimates for public housing construction were developed from previous survey data adjusted for price and productivity changes. The deflator used to adjust for price changes is the Bureau of the Census single-family price index, excluding value of lot. The index, on a 1972 base, equaled 131.6 in 1975, and 203.3 in 1979.

The estimate used to adjust the survey data for productivity change is the inverse of the change in onsite employee hours per $1,000 after adjustments for price variations, between 1968 and 1975. The average annual rate of change was 4.7 percent.

Estimates of the number of full-time jobs generated in the construction industry per billion dollars of expenditures were derived using 1,800 employee hours per year-long job for onsite construction, and 2,000 employee hours per offsite construction job.

Because of part-time workers and the seasonal nature of the construction industry, more workers would actually be employed than indicated by the full-time job estimates.

[2] This survey is one of a series of studies of construction labor requirements prepared by the Bureau of Labor Statistics. The data from this series are used to estimate the impact of Federal funding upon employment in the construction industry. The data may also be used to make budgetary decisions, aid in developing countercyclical employment and expenditure policies, assess training needs, anticipate occupational shortages and bottlenecks in skilled trades, and provide indicators of productivity change in construction.

The 1975 survey is the third public housing construction survey. See Labor and Material Requirements for Public Housing Construction (Bulletin 1402, Bureau of Labor Statistics, May 1964); Labor and Material Requirements for Public Housing Construction, 1968 (Bulletin 1821, Bureau of Labor Statistics, 1974); Joseph T. Finn, "Labor requirements for public housing," *Monthly Labor Review*, April 1972, pp. 40–42. It is one of a group of abbreviated studies which exclude detailed information on material usage and onsite occupational requirements. The 1975 public housing construction survey is the fourth abbreviated study of construction labor requirements. See John G. Olsen, "Decline noted in hours required to erect Federal office buildings," *Monthly Labor Review*, October 1976, pp. 18–22; Barbara J. Bingham, "U.S. civil works construction shows decrease in required labor," *Monthly Labor Review*, October 1978, pp. 24–29; Barbara J. Bingham, "Labor requirements for college housing construction," *Monthly Labor Review*, May 1979, pp. 28–34. In other BLS construction labor requirements studies, material and equipment expenditure data are used to develop indirect employment estimates for the industries which mine, manufacture, and transport the construction materials required. The abbreviated studies are designed to allow more frequent measurement of the labor requirements of different types of construction, as well as to reduce survey costs. Detailed data on materials, equipment, and occupational distribution will be included in the next survey of public housing construction. For reference, summaries of cost components and occupational requirements from the previous surveys are included in this article.

The information in this article is based on a probability sample of 67 public housing projects completed in 1975. Of these, 35 were turnkey projects and 32 were conventional. The sample frame was stratified two ways. The primary division was by the four broad regions of the Bureau of the Census. Within regions, projects were directly grouped by development type (conventional or turnkey), as well as implicity by size of contract. The measure of size used was the estimated development cost (ETDC) provided by the Department of Housing and Urban Development, (HUD). The number of units in the universe was 296. Based on estimates of standard errors computed on previous construction survey results, a Neyman allocation was used to determine the number of projects in each region. Within regions, the square roots of the ETDC's were used to determine the number of projects for each development type. Within the eight strata thus obtained, projects were ordered by magnitude of ETDC, and the sample was drawn using probability proportionate to size. A sample of 65 projects was being selected plus a 10 percent oversample for non-response.

A case study of several rehabilitation and leased projects was included in the survey. Data on the leased projects, however, were insufficient for publication. Data for the rehabilitated projects are being reviewed for possible future publication. The sample projects were randomly selected from a universe of 296 projects supplied by area offices of HUD. The projects are grouped by geographic region, and data are presented on a regional as well as national basis. The four geographic regions are: Northeast—Connecticut, Maine, Massachusetts, New Hampshire, New Jersey, New York, Pennsylvania, Rhode Island, and Vermont; North Central—Illinois, Indiana, Iowa, Kansas, Michigan, Minnesota, Missouri, Nebraska, North Dakota, Ohio, South Dakota, and Wisconsin; South—Alabama, Arkansas, Delaware, District of Columbia, Florida, Georgia, Kentucky, Louisiana, Maryland, Mississippi, North Carolina, Oklahoma, South Carolina, Tennessee, Texas, Virginia, and West Virginia; and West—Arizona, California, Colorado, Idaho, Montana, Nevada, New Mexico, Oregon, Utah, Washington, and Wyoming.

Although the national and regional data provided by the survey are believed to be accurate, the detailed data would have a wider margin of sampling error and may be subject to other limitations. Except for nonresponding sample units and estimated data, there are no known sources of nonsampling error. Sampling variances are being prepared by the Bureau.

[3] Employee-hour and employee-year estimates for offsite construction were derived from the ratio of "nonconstruction" workers to total workers among general building contractors and special trade contractors (Standard Industrial Classifications 15 and 17) as shown in *Employment and Earnings, United States*, 1909–78 (BLS Bulletin 1312–11). The data were adjusted to remove the portion of clerical and administrative hours already included in onsite hours.

[4] Estimates for 1975 and 1979 were based upon data from the 1968 survey which included detailed data on equipment and material usage.

[5] Cost distribution for 1975 is based on conventional and turnkey projects; 1960 and 1968 figures are based on conventional projects only. The costs for 1975 are estimates made by the general contractors, and should not be construed as representing actual costs as collected in complete labor and material requirements surveys. Actual construction cost components can only be obtained from subcontractors.

[6] "Overhead" includes salaries for offsite workers, supplemental benefits, insurance, construction financing charges, and other miscellaneous expenses.

Caution: sociocentrics at work

Though the conformist and entrepreneurial value systems have long characterized the American work force, particularly at the managerial levels, recent years have witnessed rejection of the materialism and commercialism of these value systems. Concern with the quality of life and disdain for traditional status symbols characterize the values of many newcomers to the work force. They tend toward strong affiliation needs—getting along with others seems to be more important than getting ahead in the organization. They wish to be respected by those whom they respect. Though their informality and sometimes unkempt appearance may be disconcerting to traditional managers, they are capable of productive effort under appropriate supervision and provided they are not involved with what they see as harmful products such as napalm, bombs, or pesticides. Being a manager of their own jobs is an appealing concept to sociocentrics, particularly when they can relate to supervision on a first-name basis and are free to experience solidarity with other members of the work force.

An existential personality type is also encountered with increasing frequency in work forces. He or she tends to ignore protocol, shun status symbols, and resent bureaucratic constraints and the use of authority. This person can accept people whose values differ from his or her own as long as they don't try to impose those values. This person is a goal-oriented individual whose behavior seems to say, "OK, I understand the job to be done; now leave me alone and let me do it my way." Being his or her own manager is the only acceptable condition of employment, and if deprived of this opportunity, the person is likely to leave the organization or to become preoccupied with personal goals on company time.

In summary, "every employee a manager" is a universally applicable concept, but one that depends on appropriate job conditions for its fullest implementation. Every person has the potential for managing some jobs, but not all jobs. However, every person has the potential for managing certain components of any job or combinations of several jobs. The realization of this potential depends on matching the person's talents and aspirations with the appropriate job, particularly if the employee has an influential role in the matching process. The "job" in this case refers not only to the work itself, but also to style of supervision, procedural constraints, peer relationships, and other climate factors in the workplace.

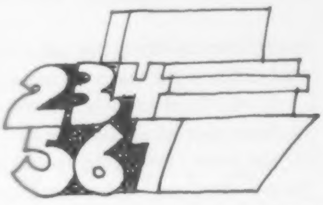
Publishing Co., 1978), pp. 37–38.

The Anatomy of Price Change



Inflation slows in third quarter, although food prices soar

CRAIG HOWELL, WILLIAM THOMAS, AND EDDIE LAMB

The pace of inflation slowed to a single-digit rate from June to September, primarily because of a sharp drop in mortgage interest costs. The Consumer Price Index for All Urban Consumers (CPI-U) rose at a seasonally adjusted annual rate of 7.0 percent during the third quarter, the slowest rate since the final quarter of 1977. The CPI had risen at an 11.6-percent rate in the second quarter of 1980 and at an 18.1-percent rate during the opening months of the year. The mortgage interest cost index, which had advanced at an annual rate of more than 50 percent during each of the three preceding quarters, decreased at a rate of 30.3 percent. (See table 1.)

Excluding mortgage interest costs, however, the rate of inflation at the retail level accelerated from 7.5 percent in the second quarter to more than 12 percent in the third. The third quarter rate was still somewhat slower than the first quarter rate of nearly 15 percent. Most of the acceleration in the third quarter was caused by sharply higher food prices. When both food and mortgage interest costs are excluded, the CPI moved up at an annual rate of 9.7 percent, slightly more than in the previous quarter (9.0 percent), as retail prices for most other major categories of consumer spending rose more than they did from March to June. However, the rate of increase in energy prices—which had slowed dramatically from a 64.8-percent rate in the first quarter to an 8.1-percent rate in the second—slowed again to a rate of about 3 percent.

At the primary market level, the Producer Price Index (PPI) for Finished Goods advanced at a seasonally adjusted annual rate of 13.0 percent, far faster than the 6.0-percent rate of increase registered in the previous quarter but considerably less than the 19.3-percent rate recorded in the first 3 months of the year. Food prices climbed even more sharply than in the CPIfollowing declines during the first half of 1980. Price increases also accelerated, although more moderately, for consumer goods other than food and energy. In contrast, energy prices dropped somewhat from June to September, after rising at a rate of 17 percent in the second quarter and at a rate in excess of 100 percent in the first. Prices for intermediate materials rose much more than in the preceding 3 months, and crude material prices soared after falling during the first half of the year.

Food and related products

The CPI for food advanced at an 18.9-percent annual rate from June to September, after rising more moderately in both preceding quarters. At the primary market level, the PPI for finished consumer foods surged at a 36.9-percent rate, after falling during the first half of the year. (See table 2.) Much of the increase in food prices during the third quarter reflected the effects of unusually hot summer weather. A severe drought hampered production and affected marketing at the farm level, particularly for grains, hay, oilseeds, livestock, and live poultry. Consequently, the PPI for crude foodstuffs advanced steeply in July and August, before stabilizing in September. Retail food prices were also influenced by earlier increases for energy and for other distribution costs. The index for food away from home rose at an 8.2-percent rate, about the same as in the second quarter.

Retail and processor prices for meats and poultry soared from June to September, buoyed by skyrocketing prices for hogs, cattle, and live poultry. The CPI for pork rose at a 75.0-percent annual rate, reflecting increased prices for hogs. Hog marketings declined in the third quarter, a result of fewer pigs born in the early months of 1980. In addition, intense heat limited weight gains and caused some delay in marketings. There were also fears that the future hog supplies would be reduced by a decline in fertility rates caused by the heat. Processed poultry prices increased at an annual rate of 82.7 percent in the CPI. Live poultry prices soared because of higher feed costs and sharply curtailed marketings after the intense heat killed millions of chickens.

Retail prices for beef and veal rose at a 22.4-percent annual rate, partly in response to good demand as a result of higher prices for its competitors, pork and poultry. At the farm level, cattle prices increased sharply, reflecting smaller offerings of grain-fed cattle. Cattle farmers continued to rebuild herds after periods of heavy slaughter. Meanwhile, marketings of grass-fed

---

Craig Howell, William Thomas, and Eddie Lamb are economists in the Office of Prices and Living Conditions, Bureau of Labor Statistics. They were assisted by Andrew Clem and Mary Burns, economists in the same office.

cattle increased in the summer when pastures dried up and cattle were taken to market earlier than usual.

At the farm level, grain prices climbed at an unusually steep rate after declining substantially in the first half of the year. Prices for most grains were higher as reduced harvests were anticipated as a result of the drought. Good export demand also contributed to the price strength of grains. Many farmers deliberately held back grain marketings in hopes of more favorable prices later. Prices soared for corn, oats, and barley; wheat prices also moved up, but not as rapidly as other grains. There was a record harvest of winter wheat, which was not affected by the drought; spring wheat was adversely affected, but it normally accounts for less than 25 percent of total domestic wheat production.

[1] See "Definitions" and "Notes" preceding tables 22–30 Current Labor Statistics in this *Review*.

[2] Not seasonally adjusted.

NOTE: Monthly data for Producer Price Indexes have been revised through May 1980 to reflect the availability of late reports and corrections by respondents. For this reason, some of the figures shown above and elsewhere in this report differ from those previously published.

Prices for oilseeds and hay also advanced from June to September. Soybean prices skyrocketed as adverse weather reduced prospects for the domestic crop; expectations of smaller crops in South America also helped to drive soybean prices higher. Prices for manufactured feeds rose in response to increased costs for ingredients, particularly grains and oilseeds.

Prices for cereal and bakery products rose, largely because of higher costs of grains and energy. Fats and oils were higher, a result of higher costs for ingredients. Prices for soybean oil, a key ingredient in many canned foods, rose sharply because of increased costs for soybeans and rising energy costs associated with the crushing process.

Prices for fresh fruits and vegetables moved up sharply in both retail and farm markets. Among fresh vegetables, the largest increases occurred for both white and sweet potatoes because of reduced acreage and the effects of hot, dry weather. The rapid price increases for fresh fruits followed moderate increases earlier in the year. Citrus fruits accounted for most of the surge.

Prices for sugar and sweets moved up at both the retail and processor levels, reflecting earlier cost increases for raw sugar, fructose, and energy. Raw sugar rose sharply in August, as crop disease and adverse weather in many growing areas reduced production throughout the world. Prices were higher for packaged cane sugar, beet sugar, and corn syrup. On the other hand, prices for chocolate products declined in response to falling prices of cocoa beans, a result of excellent supplies.

Roasted coffee prices fell for the third consecutive quarter at both the retail and processor levels, reflecting lower prices for green coffee. Green coffee prices dropped as a result of unseasonably mild weather in Brazil, the world's leading producer, which often experiences damaging frost conditions during the third quarter. Downward pressure was also exerted by a continuing decline in coffee consumption in the United States. Tea prices moved up because of drought conditions in some producing countries.

Services, excluding energy

Prices of consumer services other than energy declined at an annual rate of 1.8 percent in the third quarter, in contrast to increases at rates of 21.0 and 20.0 percent in the first and second quarters of 1980. (See table 3.) The sharp decline in contracted mortgage interest costs (a component of the household services index) was primarily responsible for the downturn. Charges for transportation, medical care, and entertainment services continued to move up.

Table 2. Changes in retail and producer prices for consumer foods, 1979–80

Commodity	Index	Relative importance December 1979	Compound annual rate, seasonally adjusted except as noted, for 3 months ended —

[1] Includes items not listed. The CPI includes prices of food away from home, which account for about 31 percent of the food index. The PPI for finished consumer foods does not reflect restaurant prices.

[2] Not seasonally adjusted in the CPI.

[3] "Sugar and confectionery" in the PPI. Not seasonally adjusted in the PPI.

[4] "Vegetable oil end products" in the PPI.

The index for household services other than rent and energy decreased at a 13.2-percent rate, after rising at rates of 29.2 percent in the second quarter and 29.9 percent in the first. This reversal was caused by a steep drop (a 30.3-percent rate) in mortgage interest financing costs, as a 37.7-percent rate of decline in mortgage interest rates was only partially offset by a 14.9-percent rate of increase in house prices.[1] The index for property insurance rose at an 8.2-percent rate, a slower pace than that registered in either of the two preceding quarters. The index for property taxes rose at a 7.7-percent rate, following a second-quarter decline, and a first-quarter advance at a 4.8-percent rate. Price increases for the home maintenance and repairs index were the smallest since the third quarter of 1977. This index advanced at a 6.1-percent rate in the third quarter of 1980, after advancing at a rate of 6.7 percent in the second quarter, and 20.0 percent in the first. The housekeeping services index rose at a rate of 6.4 percent after rising at a rate of nearly 9 percent in both the first and second quarters.

The index for transportation services moved up at a rate of 13.3 percent, a somewhat slower rate than in either of the two previous quarters. The slowdown was due to a 12.6-percent rate of decrease in automobile finance charges, which had climbed at a 46.0-percent rate during the first half of 1980. On the other hand, charges for public transportation rose much faster (at a

[1] Not seasonally adjusted.

56.7-percent rate) than earlier in the year, reflecting large increases in fares for airlines, intracity mass transit, intercity buses, and taxis.

Charges for medical care services were up at a 9.3-percent rate, more than in the second quarter, but substantially less than in the first. The professional services category (physicians' and dental services) rose at a rate of 9.0 percent, the slowest quarterly advance over the past 12 months. However, the hospital services index climbed at an 18.5-percent rate, far more than in the previous 3 months.

Among other services, the CPI for apparel services increased at a 6.5-percent rate, the smallest increase since the third quarter of 1976. This moderation reflected a slowdown in charges for laundry and drycleaning services. The pronounced third-quarter acceleration in the index for personal and educational services was primarily due to increases in college tuition. These charges, which generally increase once a year, were 10.2 percent higher in September 1980 than they were a year earlier.

Energy

Prices for most energy goods and services continued a moderating trend which had begun in the second quarter. Consumer prices for energy items moved up at a rate of 2.9 percent, while producer prices for finished energy goods declined at a 3.4-percent rate. (See table 4.) In contrast, retail energy prices had climbed 47.2 percent between March 1979 and March 1980. The improved energy price situation reflected a large surplus of crude petroleum on world markets. Consumption of oil by the industrialized nations declined because of a general drop in business activity, as well as reductions in consumer demand induced by the earlier sharp price hikes.

One major reason for the surplus was that Saudi Arabia decided to continue exporting greater-than-normal amounts of crude oil. This decision made it more difficult for other Organization of Petroleum Exporting Countries (OPEC) members to raise prices on their own. As a result, there were no major price increases by OPEC between July and September. However, prices continued to vary widely among OPEC members, even after the latest meeting of OPEC oil ministers in September.[2]

The reduced demand for petroleum products in this country was reflected in the unusually low rate of refinery capacity utilization (about 74 percent in the third quarter, compared with about 90 percent at the same time in 1978). At the same time, primary stocks of both crude and refined petroleum were substantially above seasonal norms.

As a consequence of sluggish demand, retail gasoline prices moved down for the second consecutive quarter, and prices received by refiners turned down after decelerating substantially in the previous quarter. Prices for

home heating oil edged upward at both the consumer and the producer level. Within the PPI for intermediate energy goods, price increases continued to slow for diesel fuel and jet fuel.

Prices for commercial and industrial electric power advanced more sharply than during the first 6 months of the year. One of the principal reasons for this acceleration was the heavy demand associated with increased use of air conditioning units in much of the country during the unusually hot summer. However, residential electricity rates did not rise nearly as rapidly as in the previous quarter. Similarly, consumer prices for piped gas increased less than in the prior 3-month period.

The PPI for crude energy materials advanced at a 22.9-percent annual rate, slightly more than in the previous quarter, but not as fast as the 37.1-percent rise in the 12 months ended in March. Prices of natural gas at the wellhead increased at a 36.5-percent annual rate, following three quarters of advances at annual rates of about 25 percent. This acceleration reflected the expanded output of new gas fields which are not under price controls, as well as higher prices for gas imported from Canada. The index for crude petroleum (which only includes domestic production) moved up somewhat less than in the previous quarter, as higher prices for upper and lower tier crude oil were partly offset by small declines in prices of uncontrolled oil in weak markets.

Finished goods, excluding food and energy

Consumer goods. In the CPI, prices for commodities except food and energy moved up at a seasonally adjusted annual rate of 12 percent, following advances at rates of 9.7 and 7.3 percent in the first and second quarters. (See table 5.) Price increases also accelerated somewhat at the producer level, as the PPI for consumer goods other than foods and energy rose at an 8.8-percent rate, after increasing at a 7.7-percent rate in the previous 3 months, and climbing at an 18.1-percent rate in the first quarter.

Domestic passenger car manufacturers raised their

prices at the beginning of the quarter to pass through earlier increases in the costs of metals and other inputs. Prices of imported cars also continued to rise as a result of generally good demand and changes in foreign exchange rates. Used car prices increased at a rate of about 40 percent from June to September, reversing a declining trend that was dominant for much of the first half of the year.

In the PPI, substantial advances for passenger cars in July and August were balanced by a steep drop in September. The September decrease reflected "liquidation allowances" granted by domestic producers to their dealers for each 1980 car left on their lots when 1981 cars first went on sale.[3] If this had not occurred, producer prices for passenger cars would have risen at a rate of 19.6 percent in the third quarter, and the PPI for consumer goods other than foods and energy would have advanced at an 11.8-percent rate. The new car CPI rose at a rate of 15.3 percent from June to September.

Home purchase prices rose at an annual rate of 14.9 percent in the third quarter, the same as in the previous 3 months. This index has risen at a double-digit rate in every calendar quarter but two since the end of 1977, partly reflecting intensive demand for homes as a hedge against inflation. Shifts in demographic factors have also served to bolster demand for homes.

Jewelry prices resumed their strong upward climb during the third quarter, after slowing abruptly in the spring. This reacceleration reflected an upturn in gold and silver prices, which had soared early in the year and then had fallen sharply as part of a widespread commodity price decline.

Capital equipment. The Producer Price Index for capital equipment moved up at an 8.8-percent annual rate from June to September on a seasonally adjusted basis, less than in any calendar quarter over the past year. However, the slowdown was due to the introduction of liquidation allowances for cars and trucks into the September index. Without this factor, the capital equipment index would have advanced at a rate of 13.2 percent, more than in the second quarter and about as fast as in the first 3 months of the year.

Motor truck prices climbed rapidly in both July and August; price increases were concentrated in the heavier trucks, which continued to sell well in spite of the general economic sluggishness. Demand for light trucks and vans remained weak, in part because relatively poor gas mileage for many domestic models discouraged prospective buyers. The actual third quarter rate of increase in truck prices was 10.9 percent; but if it were not for the liquidation allowances incorporated into the September index, truck prices would have jumped at a rate of 28.5 percent.

Among other kinds of capital equipment, price increases accelerated for railroad equipment, fixed-wing utility aircraft, and transformers and power regulators. On the other hand, prices rose less than in the second quarter for machine tools, mining machinery, and oilfield machinery. For the second consecutive quarter, prices for both office machinery and commercial furniture moved up at a rate of less than 5 percent.

Intermediate goods, excluding foods and energy

The PPI for intermediate materials less foods and energy moved up at a 6.0-percent seasonally adjusted annual rate in the third quarter, slightly more than in the second quarter, but substantially less than in any calendar quarter during the 2 years prior to that. However, if the impact of volatile price fluctuations in precious metals (particularly for silver) were removed, the rate of increase for this index would have been slightly less than in the second quarter. This continued moderate trend reflected weak industrial demand.

The nondurable manufacturing materials index slowed considerably, rising at a 4.5-percent annual rate following much more rapid advances in each calendar quarter since late 1978. The slump in business activity, combined with stabilized prices for crude petroleum on world markets, led to lower prices for organic industrial chemicals and plastic resins and materials. Similarly, prices for synthetic rubber were virtually unchanged as low production levels of motor vehicles reduced demand for tires. Paperboard prices turned down in response to the reduced output of paperboard boxes, and the rate of increase slowed markedly for paper and woodpulp.

On the other hand, leather prices turned upward substantially after declining during the first half of the year, reflecting a similar pattern in cattle hide prices. The index for inedible fats and oils also turned upward sharply, as a result of the reduced weight of slaughtered livestock. The inorganic chemicals index rose rapidly for the third consecutive quarter, largely because of sharply higher prices for caustic soda. Production of caustic soda was reduced as a result of a cutback in output of its coproduct, chlorine; this occurred because of weak demand for plastics, which often contain chlorine compounds. Among textile materials, prices for synthetic fibers advanced at a double-digit rate for the third consecutive quarter, as producers reduced output to match a decline in demand. Gray fabric prices turned up sharply after moving down from March to June; the third-quarter increases were attributed to higher costs for cotton and synthetics.

The index for durable manufacturing materials rose at a 3.8-percent annual rate, reversing the decline of the previous quarter. Much of this upturn was caused by nonferrous metals; prices for silver, copper, lead, and tin rebounded after falling from March to June, and gold prices climbed more than in the second quarter. A strike by copper workers in this country caused a reduction in supplies, and heavy purchases by the Soviet Union raised lead prices. Prices for jewelers' materials continued to rise rapidly, reflecting the upsurge in prices for gold and silver. In contrast, the finished steel mill products index declined at a 9.2-percent annual rate as steel firms introduced discounts in July for steel sheets, strips, and bars in reaction to poor demand for these items, which are used in making automobiles and appliances. Overall domestic shipments of finished steel products were about one-third less during the summer than they were a year before. Weak demand also resulted in a drop in hardwood lumber prices for the third consecutive quarter.

The construction materials index moved up at a 5.7-percent annual rate, somewhat more than in the previous quarter, but less than in any calendar quarter during the preceding 3 years. As a result of the sharp decline in mortgage interest rates between April and July, the rate of new private residential construction began to recover in June after a steep drop that had begun in late 1979. However, interest rates turned upward in late summer, curtailing the availability of mortgage credit and driving many potential homebuyers out of the market. Closely mirroring the fluctuations in the level of housing sales, softwood lumber and plywood prices advanced early in the quarter, but turned downward in September. Millwork prices rose steadily following a second quarter decline, reflecting higher labor costs. Prices for most other construction materials exhibited weakness, reflecting the earlier sharp drop in housing starts and the easing of cost pressures on energy-intensive materials. The indexes for gypsum products and refractories registered declines, and prices rose considerably less than in the first half for concrete products, plumbing fixtures, and fabricated structural metal products.

Among other intermediate goods, the index for electronic components continued upward, rising at a 13.5-percent annual rate. About one-third of this increase was caused by higher prices for capacitors, a consequence of higher costs of the metal tantalum. Prices also rose substantially for motor vehicle parts, nonfarm tractor parts, and machine tool parts. In contrast, wooden pallet prices continued to decline, reflecting a low volume of manufacturing shipments.

Crude nonfood materials, excluding energy

The index for crude nonfood materials less energy moved up sharply at a 78.9-percent annual rate, following a decrease at a rate of 38.0 percent in the second quarter. The dramatic upturn was broad-based, as prices for scrap metals, raw cotton, hides and skins, and natural rubber all climbed rapidly after falling earlier in the year.

Iron and steel scrap prices, which had declined at a rate of 46.8 percent during the first half of the year, soared in the third quarter. Strong export demand and tight supplies, a result of abnormally low prices which forced some dealers out of the market, were the major factors in this abrupt price resurgence. Increased demand from secondary smelters and higher prices for primary copper lifted prices for copper base scrap, which had declined in both previous quarters. Improved demand from Japan raised prices for aluminum base scrap, following a severe slump in the second quarter.

After falling in the previous quarter, prices of raw cotton climbed rapidly, as hot, dry weather led to expectations of a much smaller domestic cotton crop than in most recent years. The U.S. Department of Agriculture estimated that the 1980 cotton crop would be 20 percent smaller than last season. Export demand for cotton also improved. Hides and skins prices climbed at a rate of almost 80 percent, in contrast to a 58.5-percent rate of decrease during the first half; heavier demand from the Far East and from domestic tanners, combined with poor supplies, pushed prices higher. Crude natural rubber prices advanced following a second-quarter drop because of the impact of the border disputes between Thailand and Cambodia. Much of the natural rubber imported into this country normally comes from Thailand. On the other hand, wastepaper prices fell for the second consecutive quarter because of continued poor demand from domestic paperboard mills and the building materials industry. □

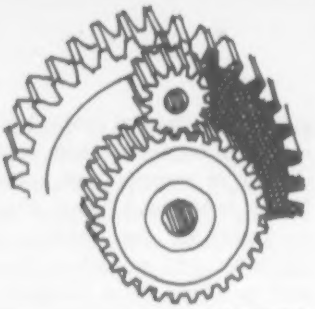
FOOTNOTES

[1] Mortgage interest rates in the CPI are represented by conventional, FHA, and VA rates. Although FHA and VA ceiling rates were raised from 11.5 to 12 percent late in the third quarter, conventional rates declined sharply in all 3 months. Conventional rates are represented in the CPI by actual mortgage loan transactions and not by current commitment rates.

[2] As a result of the September 1980 OPEC conference, Saudi Arabia lifted its basic price from $28 per barrel to $30 for the fourth quarter; this was still the lowest official contract price within OPEC. The highest officially allowed price within OPEC remained at $37 per barrel. The war between Iraq and Iran, which broke out in September, did not have any significant impact on crude oil prices in the third quarter.

[3] This marked the first time that the Bureau of Labor Statistics succeeded in reflecting these annual liquidation allowances in the PPI, as part of a stepped-up commitment to obtain realistic transaction prices whenever possible. The CPI has, in effect, always reflected the impact of such discounts each September.

Productivity Reports



Sixth consecutive productivity drop recorded during the second quarter

LAWRENCE J. FULCO

Exceptionally large declines in output and proportionately smaller decreases in hours during the second quarter of 1980 were reflected in falling productivity in all sectors of the economy for which the Bureau of Labor Statistics prepares quarterly productivity measures. Productivity in the private business sector declined 2.7 percent—the sixth consecutive quarterly drop in output per hour of all persons.

This is the second longest period of continuously falling productivity for the sector. By the second quarter of 1980, productivity had decreased about 2.5 percent cumulatively over six quarters. A steeper and longer decline, lasting seven quarters, occurred during the 1973–74 downturn. As of the third quarter of 1974, private business productivity had fallen 4.3 percent, also after six quarterly drops.

Output declined at a 12.0-percent annual rate in second quarter 1980, the first such drop in the private business sector in a year. However, it was the largest quarterly decrease in three decades.

In the nonfarm business sector, productivity fell at a 3.7-percent annual rate. This decline was larger than the drop in the private business sector, owing to productivity gains in the farm sector during the second quarter.

Nonfinancial corporations marked six quarters of continuously falling productivity with a 1.9-percent drop in the second quarter. These corporations, which account for about two-thirds of private business hours, also showed a 0.1-percent decline in the first quarter.

Output per hour declined 4.7 percent among manufacturing industries, but the drop in nondurables was much greater than that in durables. This was the third consecutive quarter of productivity decrease in manufacturing.

Chart 1 traces the growth of productivity, hourly compensation, and unit labor costs in major sectors of the economy since 1967. The following tabulation shows the second-quarter annualized rates of change in productivity, output, and hours paid for by major sector; more complete information may be found in tables 31–34 of the Current Labor Statistics section of this issue:

Sector	*Productivity*	*Output*	*Hours*
Private business	−2.7	−12.0	−9.6
Nonfarm business	−3.7	−12.3	−8.9
Nonfinancial corporations	−1.9	−11.5	−9.8
Manufacturing	−4.7	−21.8	−18.0
Durable	−3.2	−25.5	−23.0
Nondurable	−7.5	−16.4	−9.6

Compensation, labor costs, and profits

Hourly compensation in the private business sector grew faster in the second quarter than at any time since the third quarter of 1974. The 12.0-percent annual rate of increase in compensation payments, combined with the decline in productivity, resulted in a 15.1-percent rise in unit labor costs (compensation per unit of output). These costs grew faster in the second quarter of 1980 than at any other time since the third quarter of 1974.

In the nonfarm business sector, hourly compensation rose at a 10.8-percent annual rate in the second quarter, contributing to a 15.0-percent increase in unit labor costs.

Hourly compensation in nonfinancial corporations grew at an annual rate of 11.1 percent in the second quarter, and unit labor costs rose 13.2 percent. Unit profits in the nonfinancial sector declined 34.7 percent (annualized) in the second quarter—the sixth in a series of quarterly decreases which have cumulatively reduced unit profits by about 22 percent.

Among manufacturing industries, hourly compensation gains were somewhat larger in durables. However, unit labor costs grew faster among nondurable goods producers, partly reflecting the steeper decline in their productivity.

Although hourly compensation increased rapidly in the second quarter, the faster rise of the Consumer Price Index for All Urban Consumers (CPI-U) caused a reduction in real compensation in the private business and nonfarm business sectors. The 13.7-percent annualized advance in the CPI-U is the third highest quarterly price increase in the series.[1] When compensation payments were adjusted for changes in the CPI-U, real hourly compensation in the private business sector declined

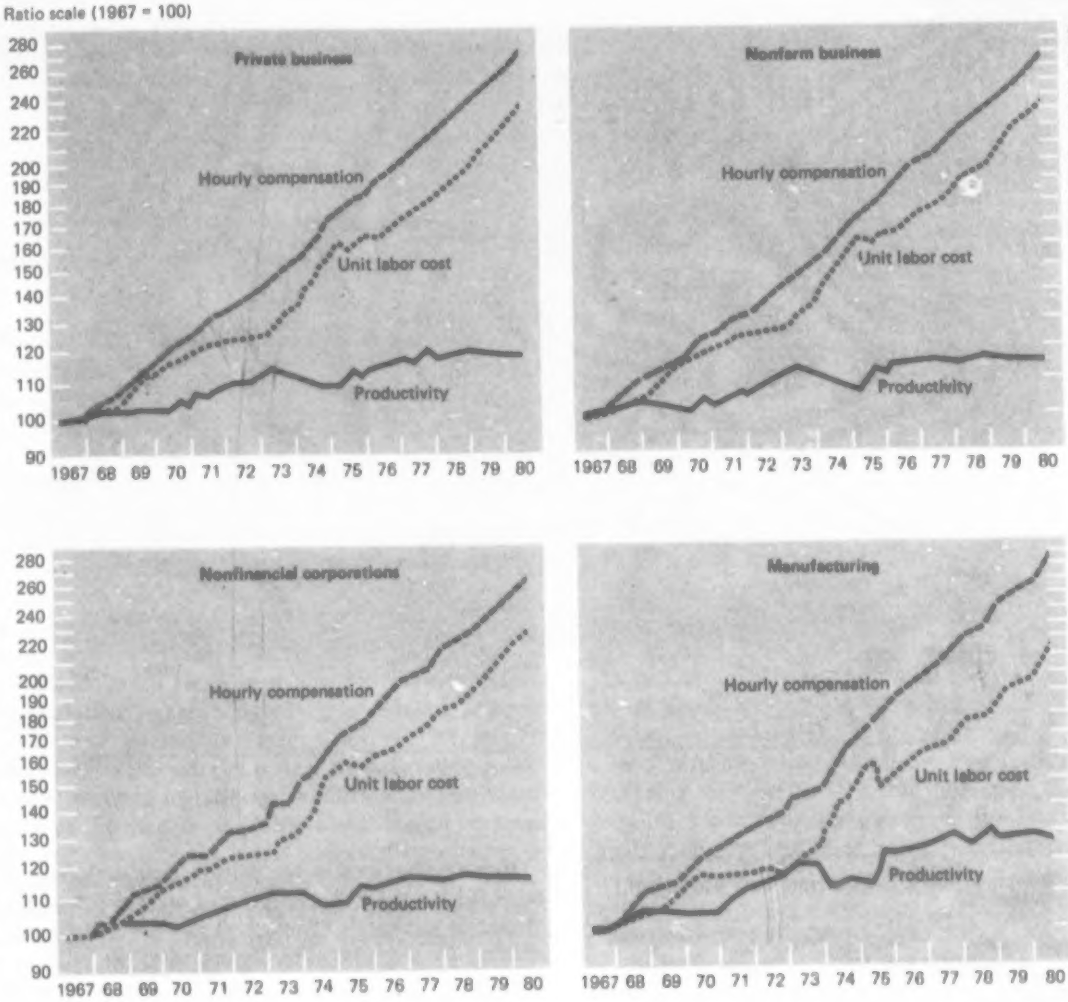
Lawrence J. Fulco is an economist in the Office of Productivity and Technology, Bureau of Labor Statistics.

Chart 1. Changes in productivity and related measures in four major sectors of the economy, 1967-80



at a 1.5-percent annual rate during the second quarter.

Real hourly compensation has not risen in the private business sector since the first quarter of 1978. After more than two years of decline, the measure has fallen to its third-quarter 1975 level. Chart 2 shows that while hourly compensation has increased rather smoothly since 1967, trends in real compensation tend to reflect variations in the rate of growth of the CPI-U.

Employment and hours

Employment in the private business sector fell 5.5 percent in the second quarter—down 1.1 million jobs to 79.5 million—ending a pattern of growth which had been unbroken since mid-1975. This was the only quarterly employment decline since 1975. Average weekly hours dropped from 37.0 in the first quarter to 36.6 in the second, the greatest quarterly reduction since 1957. Nonfarm business employment declined 5.2 percent.

Employment in manufacturing, 20.7 million in the second quarter, was down 13.2 percent from the previous period. Average weekly hours in the sector declined 5.6 percent to 39.6. Employment fell at an annual rate of 17.6 percent in durables and 5.9 percent in nondurables.

Chart 2. Changes in hourly compensation and real hourly compensation in the private business sector, and changes in the Consumer Price Index, 1967-80

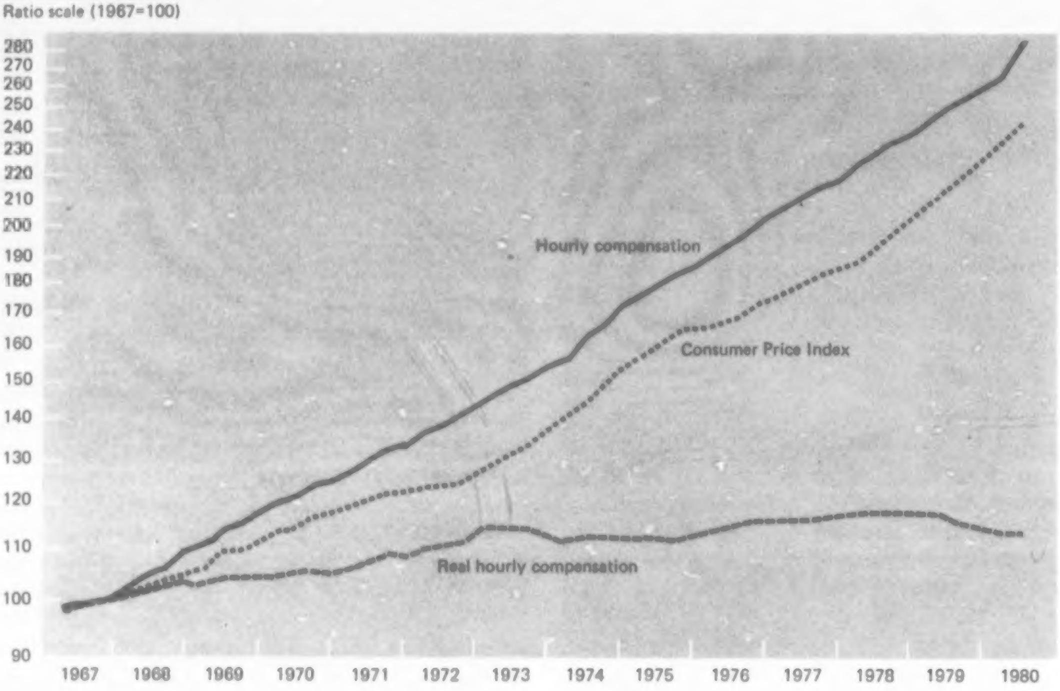


Table 1. Trends in hours in the private business sector, second quarter 1980

Worker category	Percent change in hours	Category share of hours	Contribution to trend

Sum of interaction terms[1]	......	......	-0.34

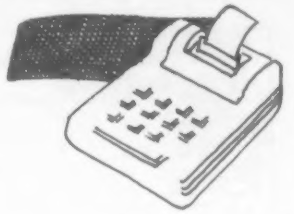
[1] A measure of how much of the overall trend results from the joint effect of the individual worker category movements.

Hours reductions in the private business sector were recorded for the great majority of worker categories included in the totals. Table 1 shows the distribution of changes in second-quarter hours, and the relative importance of the individual categories. The steepest drop in hours occurred among farm unpaid family workers, but because such workers account for only about 0.4 percent of all hours, the impact was quite small.

Manufacturing, on the other hand, represents about 28.3 percent of total hours, and its 17.31-percent decline in hours over the quarter accounted for 4.89 percentage points of the overall 9.53-percent decrease for private business. Other important components of the reduction were changes in hours among nonfarm proprietors, and employees in retail trade, construction, and on farms. ☐

——— *FOOTNOTE* ———

[1] During the first quarter of 1951, prices rose at a 17.2-percent annual rate (seasonally adjusted), and a 16.9-percent advance occurred in first quarter 1980.



Family Budgets

Autumn 1979 retired couple budget dominated by rise in transportation

Reflecting large increases in transportation, the three hypothetical budgets for an urban retired couple in autumn 1979 totaled $6,023 at the lower level, $8,562 at the intermediate level, and $12,669 at the higher level. (See table 1.) From autumn 1978 to autumn 1979, tintermediate, 9.1 percent, and the higher, 9.3 percent. (See table 2.)

Total consumption costs rose by the same amount as the total budget: 9.2, 9.1, and 9.3 percent, respectively, for the lower, intermediate, and higher budgets. The largest increase was in transportation, which increased approximately 17 percent for the lower and intermediate budgets, and 18 percent for the higher budget. Transportation in the higher budget contains a larger proportion of automobile owners, and therefore, was affected most by increases in private transportation costs.

Large increases in fuels and utilities had the greatest impact on housing costs in the lower budget, because those items constitute a larger budget share of housing at that level. Homeowner costs are based on the assumption that retired couples own their homes and have no mortgage and interest payments. Shelter costs are based on rented and owned dwellings.

The budgets represent the costs that were specified in the mid-1960's to portray three relative levels of living. They are designed for a precisely defined retired couple—a husband age 65 or over, and his wife. The couple is assumed to be self-supporting, residing in an urban area, in good health, and able to care for themselves. The budget levels provide different qualities and quantities of goods and services. The lower budget was not designed as a subsistence or poverty level, but simply as a level somewhat lower than the intermediate budget. Beginning with the autumn 1973 updating of the budgets, the total budget is defined as the sum of "total family consumption" and "other items." Income taxes are not included. The autumn 1979 cost estimates for medical care contain a preliminary estimate for "out-of-pocket" costs for Medicare.

Table 1. Summary of annual budgets for a retired urban couple, at 3 levels of living, autumn 1979

Component	Lower budget	Intermediate budget	Higher budget
Total budget	$6,023	$8,562	$12,669
Total family consumption	5,763	8,047	11,719
Food	1,882	2,507	3,149
Housing	1,996	2,862	4,481
Transportation	420	820	1,528
Clothing	225	378	581
Personal care	169	247	362
Medical care	837	842	848
Other family consumption	234	390	770
Other items	259	515	950

NOTE: Because of rounding, sums of individual items may not equal totals.

Table 2. Percentage changes in budgets for a retired urban couple, at 3 levels of living, autumn 1978 to autumn 1979

Component	Lower budget	Intermediate budget	Higher budget
Total budget	9.2	9.1	9.3
Total family consumption	9.2	9.1	9.3
Food	9.1	9.0	9.2
Housing	9.0	8.4	8.3
Transportation	16.7	17.0	17.6
Clothing	2.3	2.4	2.3
Personal care	8.3	7.9	8.1
Medical care	9.4	9.5	9.6
Other family consumption	6.4	6.6	6.6
Other items	9.3	9.1	8.6

The budget costs are updated annually and reflect autumn price levels. Users should note that the procedures used in updating the budgets in 1979 differ from those used in 1978. Because of the revision of the Consumer Price Index program in January 1978, individual area price indexes from autumn 1978 to autumn 1979 were available for only 25 of the 44 family budget areas. The urban U.S. average includes estimates for those areas, however, using price data for the appropriate region and population size classes that are available from the CPI. Nonmetropolitan areas have always been shown as a separate class, and their costs have been similarly updated. (See table 3.)

Complete data for 24 metropolitan areas; four nonmetropolitan areas; Anchorage, Alaska; total metropolitan average; and the U.S. urban average can be obtained from the Bureau of Labor Statistics or any of its regional offices.

[1] The family consists of a retired husband and wife, age 65 years or over.

[2] Total budget costs do not include personal income taxes.

[3] Housing includes shelter, housefurnishings, and household operations. The higher budget also includes an allowance for lodging away from home city.

[4] Renter costs include average contract rent plus the cost of required amounts of heating, fuel, gas, electricity;, water, specified equipment, and insurance on household contents.

[5] Homeowner costs include property taxes, insurance on house and contents, water, refuse disposal, heating fuel, gas, electricity, specified equipment, and home repair and maintenance.

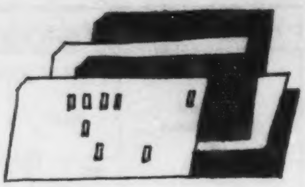
[6] The average costs of automobile owners and nonowners in the lower budget were weighted by the following proportions of families: Boston, Chicago, New York, and Philadelphia, 100 percent for nonowners of automobiles; all other metropolitan areas, 45 percent for owners, 55 percent for nonowners; nonmetropolitan areas, 55 percent for owners, 45 percent for nonowners. The intermediate budget proportions are: New York, 25 percent for owners, 75 percent for nonowners; Boston, Chicago, Philadelphia, 40 percent for owners, 60 percent for nonowners; all other metropolitan areas, 60 percent for owners, 40 percent for nonowners; nonmetropolitan areas, 68 percent for owners, 32 percent for nonowners. The higher budget proportions are: Boston, Chicago, New York, and Philadelphia, 75 percent for owners, 25 percent for nonowners; all other areas, 100 percent for owners.

[7] Includes average costs for reading, recreation, tobacco products, alcoholic beverages, and miscellaneous expenditures.

[8] As defined in 1960–61. For a detailed description of current and previous geographical boundaries, see the 1967 edition of *Standard Metropolitan Statistical Areas,* prepared by the Office of Management and Budget.

[9] Places with population of 2,500 to 50,000. Data for some places previously shown are no longer available.

Research Summaries



Women's use of time converging with men's

FRANK P. STAFFORD

Does the work history of a married woman primarily reflect her own voluntary choices between market work and other time uses, or is her work history largely the consequence of culturally prescribed differences in the household division of labor reinforced by low wages and tax considerations?

The probability of married women working has increased, but official statistics may be overstating the extent they work, particularly in terms of hours per week. This can be seen in table 1, where time diary estimates indicate a 22.7-percent decline between 1965 and 1975 in market hours of married women who worked at least 10 hours per week. The drop in hours per working married woman is sufficient to offset the increased participation rates so that, overall, married women have *decreased* their hours of employment by an estimated 2.2 percent. If work provides on-the-job training, one would still expect the earnings of married men and women to converge in the future because married men have decreased their hours of employment at a faster rate than married women, by 10.8 percent between 1965 and 1975. This includes declines associated with falling participation rates, as well as falling hours per week of those working.[1]

Unmarried women increased their labor market hours via an increased labor force participation rate and a modest increase in hours. Coupled with the growth in the number of unmarried women (partly the consequence of increased divorce rates), this means that, overall, women's hours of market work continue to approach those of men.

Research has shown that some women are more likely to stay in the labor market and others to remain at home.[2] Even when preschool children are in the household, married women, particularly those with a college education, are likely to work a good deal of the time. This does not appear to threaten the quality of child care or child-related housework: college-educated, working mothers tend to have fewer children and to meet their responsibilities by reducing their sleep and passive leisure, such as TV viewing. Working women can expect some help with child care and housework from their husbands, though the time involved is small relative to their own time. Full sharing of these responsibilities is rare.

Not only has market participation of men and women tended toward equality, but their leisure lifestyles and other nonmarket activities have also become more equal, as can be seen in table 2. Working women have decreased their time to housework, while working men have increased their housework time slightly. Among

[1] From the national time-use surveys conducted by the Survey Research Center of the University of Michigan.

[2] Labor market participation was defined by 10 or more hours of work per week.

[3] Including time at lunch.

[4] Subgroup sample sizes may not add to totals due to missing data.

working adults, total market and nonmarket work of married women and men has become quite similar. In contrast, during 1965, the total worktime of married women who were employed was substantially greater than that of married men (602 minutes per day compared to 548). Total leisure time of married women has increased and they have begun to approach married men in time spent TV viewing (105 minutes per day compared to 132).

From these data and other labor market studies, it can be concluded that women's and men's time uses are converging. Though the market worktime estimates for women are lower than the official statistics, the latter have understated the decline in men's work hours, and time-use data for 1965–75 indicate a larger decline in men's hours of market work than recorded in the Current Population Survey. Employment figures for highly educated women with preschool children suggest that there is now a greater awareness of the "full shadow value" of worktime early in the life cycle. The full shadow value includes the current wage, and the discounted value of on-the-job training acquired through labor force participation. As a result, the sacrifice of sleep and TV viewing to pursue both child care and labor market goals may be worth it, even though it implies short-run stress.

Response to preschool children

The pattern of high levels of labor market activity by college-educated women with preschool children is not observed historically. Based on analysis of 1960 census data, Arleen Liebowitz concluded that market time is usually greater the higher the level of a woman's schooling, except when preschool children are present, and then hours of highly educated and less educated women are similar.[3] Our results imply a change during the last 10 to 15 years in the market response to preschool children by college-educated women relative to other women; namely, despite a high level of per child care time, market hours are now reduced less per child by college-educated women than by high-school educated women. Our research also indicated that the amount of help by the husband, in either the form of child care or housework, is still minor.[4]

In our social security system, married women who work receive as an incremental benefit only the benefits which exceed what they could claim as a dependent. Because a woman usually earns less than her husband, the marginal discounted benefit gain from labor market activity is very small, relative to the present value of tax contributions.[5] Under the Federal income tax system, married women who work are taxed at the marginal rate applicable to the husband's earnings. In Sweden, by comparison, married individuals are taxed under the same schedule as single persons. The zero marginal tax rate on the first labor market earnings creates a larger substitution effect toward market work, while the progressive tax structure, by lowering the husband's after-tax earnings, results in a smaller income effect toward the wife's leisure.

In Sweden, many working women hold part-time jobs, perhaps because tax progression sets in rapidly there, and the after-tax payoff to longer hours declines. These tax effects toward a shorter workweek need not greatly depress part-time wages. An increased supply of part-time workers may keep wage rates high, and supply would then create its own demand.[6] If there are enough part-time job seekers, the full price of their services to firms, which includes the wage and search costs, will be partially decreased via reduced search costs. Firms will then have the incentive to restructure their work schedules to make better use of these workers, and as a result the market equilibrium wage-hours will be less hours dependent.[7]

While the current U.S. income tax policy can be argued as "unfair" to families who derive a large share of their economic well-being through market activity, a Swedish-style tax law can be regarded, by comparison, as "unfair" to the division of labor households.[8] Therefore, as a conceptual matter, the unfairness of the current policy could be remedied by taxing imputed income on nonmarket activity, rather than adopting a Swedish-style tax law. As a practical matter, taxing imputed income would be difficult due to valuation and because it is difficult to demand cash from a household activity which generates in-kind flows, if total family market income is low. As a possible solution, lowering taxes on market income is an easier way to achieve equity, but certainly this would provide redistributive gains to multiple-earner families and would further increase their number. On "fairness" grounds, the case for the Swedish-style system is stronger if the tax law is more progressive, and progressive taxes can be viewed as a policy which adversely affects multiple-earner families. Also, the political popularity of ceilings on the rate of taxation of labor market income is partly the *consequence* of the growth of multiple-earner families. ☐

FOOTNOTES

One caveat is that the 1975–76 study coincides with a recession. It could be that some of the 1965–75/76 changes in table 1 reflect business cycle effects. Suppose the difference between actual hours at work and contracted hours at work is greater during recessions, but that respondents tend to report normal or contractual hours when hours are measured by direct questioning, rather than time diaries.

[8] By Swedish style, I mean the adoption of individual earner status for married individuals, but not necessarily the adoption of the extent of progressivity. In Sweden, the 82-percent marginal tax rate is reached at an annual income level equivalent to about $20,000. By division of labor, I mean specialization by one spouse to market activity and specialization by the other spouse to nonmarket activity.

Occupational earnings in electric and gas utilities

Average straight-time hourly earnings in privately operated electric and gas utility systems ranged from $10.81 for watch engineers to $5.02 for janitors, according to a February 1978 survey conducted by the Bureau of Labor Statistics. This represents a 45 to 55 percent increase in earnings since a similar survey in November 1972. The increase compares with a 47-percent rise in average hourly earnings of all workers in the private nonfarm sector, as measured by the Bureau's hourly earnings index.

Fifty-six physical (plant) worker occupations, virtually all staffed by men, were studied in 1978. The most populous job class, journeyman line workers, averaged $8.58 per hour. Twenty-four office clerical classifications, predominantly held by women, and 19 professional and technical categories studied had average hourly earnings ranging from $10.96 for class A systems analysts, working independently or under general supervision, to $3.93 for messengers. Class B accounting clerks, numerically the largest white-collar job class, averaged $5.08 per hour.

Of the nearly 500,000 nonsupervisory workers covered by the survey, the Great Lakes and Middle Atlantic regions accounted for about 20 percent each; the Southwest, 14 percent; the Southeast, 13 percent; and the remaining regions, 10 percent or fewer. All utility systems included in the study had 100 workers or more. Of the survey's nonsupervisory workers, more than nine-tenths were in utility systems that employed at least 500 workers.

Average hourly earnings were generally highest in the Pacific States and lowest in the Southwest region. For the physical and professional/technical groups, pay levels in the highest-paying region exceeded those for the lowest paying region by about 25 percent; for office clerical workers, the corresponding pay spread was approximately 33 percent. Differences in pay levels among regions were usually greater for lower paid occupations than for relatively higher paid jobs—a trend common to BLS wage surveys.

Employees were paid mainly on a time-rated basis, typically incorporating ranges of rates for specified occupations. Almost four-fifths of the physical workers, and more than one-third of the office clerical workers, were employed by utility systems with labor-management agreements (union contracts). The major union for both groups was the International Brotherhood of Electrical Workers (AFL-CIO).

Paid holidays and vacations were provided to nearly all employees, along with eligibility for cost-sharing health, medical, and retirement plans. An employer frequently provided 9 to 12 paid holidays per year. Vacations with pay ranged from 2 to 5 weeks annually, depending on length of service.

A comprehensive report, *Industry Wage Survey: Electric and Gas Utilities, February 1978,* (BLS Bulletin 2040), is available from the Bureau or any of its regional offices. ☐

Wages and tips in hotels and motels

Tips contributed substantially to the earnings of employees in a number of hotel and motel occupations, particularly of those paid comparatively low wages, such as customer lodging attendants, and waiters and waitresses, according to a May 1978 Bureau of Labor Statistics survey of 24 areas.[1] Table waiters and waitresses employed in full-course restaurants, for example, typically received lower wages than their assistants. However, their total hourly earnings were considerably higher when tips are included. (See table 1.)

Tipped occupations. Tips constituted a significantly high proportion of total hourly earnings for waiters and waitresses, customer lodging attendants, and bartenders who directly serve the public, than for employees with little or no direct contact with customers, such as service bartenders, and waiters' and waitresses' assistants. In 4 of the 5 categories of waiters and waitresses having personal contact with customers, tips accounted for at least 50 percent of the workers' total earnings in a majority of the 23 areas for which comparisons could be made.

In contrast, tips for service bartenders, and waiters' and waitresses' assistants in full-course restaurants where tips are often shared, usually averaged less than 25 percent of total hourly earnings. Customer lodging attendants received between 40 and 60 percent of their earnings from tips in 16 of the 23 areas compared.

Among occupations where tips are important wages for both public and service bartenders averaged at least $3 an hour in most areas; for customer lodging attendants, and waiters' and waitresses' assistants, between $1.75 and $3; and for waiters and waitresses, less than $2 an hour. The Fair Labor Standards Act permits tips up to 50 percent of the minimum wage and the reasonable cost of board and lodging to be credited against the Federal minimum wage.[2]

Table 1. Average hourly earnings and employer-paid wages for workers in selected occupations in hotels and motels, 24 areas, May 1978

Region and metropolitan area	Waiters and waitresses, full-course restaurants		Waiters' and waitresses' assistants, full-course restaurants	
	Earnings [1]	Wages [2]	Earnings [1]	Wages [2]

San Francisco-Oakland	8.23	3.15	5.74	3.16

[1] Refers to employer-paid wages plus estimated average hourly customer tips.

[2] Refers to employer-paid straight-time wages, excluding premium pay for overtime and for work on weekends, holidays, and late shifts; also excluded are tips and the value of free rooms, meals, and uniforms, and nonproduction payments, such as Christmas and yearend bonuses.

[3] Information on tips was not available.

Nontipped occupations. For nontipped occupations, stationary engineers were among the highest paid, ranging hourly from $9.66 in Las Vegas to $4.67 in Miami. General maintenance mechanics and second cooks averaged between $4 and $6 an hour in most of the 24 areas.

In May 1978, occupational pay levels for nonoffice, nonsupervisory workers in the hotel and motel industry were usually highest in Las Vegas, followed closely by New York and San Francisco. Lowest averages among the occupational categories generally were found in Buffalo, Miami, and St. Louis.

Most hotels and motels provided paid holidays, typically 6 to 8 days annually, and paid vacations after specified periods of service. Life, hospitalization, surgical, and basic medical insurance were available to at least 70 percent of workers in most of the 24 areas. Retirement pension plans (other than Federal social security) applied to at least half of the workers in 14 areas.

A comprehensive report, *Industry Wage Survey: Hotels and Motels, May 1978,* BLS Bulletin 2055 is for sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402. ☐

FOOTNOTES

---

[1] The survey covered commercial establishments, known to the public as hotels, motel-hotels, motels, and tourist courts, which primarily provide lodging or lodging and meals, for the general public. It covered establishments that operate at least nine months a year, and employ at least 20 workers. In May 1978, the 1,850 surveyed establishments employed about 188,200 nonoffice, nonsupervisory workers. Information on "wages" relates to employer-paid straight-time wages, excluding premium pay for overtime and for work on weekends, holidays, and late shifts. Also excluded are tips, and the value of free rooms, meals, and uniforms, and nonproduction payments such as Christmas and yearend bonuses. "Earnings," on the other hand, refer to employer-paid wages plus estimates of customer tips.

[2] At the time of this study, the applicable minimum wage was $2.65 per hour. The current minimum wage is $3.10 per hour.

Building wage gains accelerate in 1978–79

Following 2 years of smaller increases, hourly wage rates of union building trades members in large cities rose by an average of 6.9 percent between July 3, 1978 and July 2, 1979. These findings are based on the Bureau of Labor Statistics annual studies of cities with populations of 100,000 or more.[1] The increase raised the Bureau's index of union building trades wage rates to 239.9 (1967 = 100). Average annual wage increases for union building trades fluctuated widely during the 1970's, which witnessed a period of wage and price controls early in the decade, as well as varying levels of both union and nonunion construction activity. (See table 1.)

Among the 25 journeyman trades studied, machinists reported the largest average increase, 11.5 percent, and elevator constructors, the smallest, 4.8 percent. Carpenters, the largest occupational group, averaged a 6.8-percent rise, while the rate for building laborers, the predominant job among the nine helper and laborer classifications measured, advanced 7.3 percent.

Table 1. Hourly wage rate increases for union building trades by year, 1969–79

[In percent]

Year	All building trades	Journeyman trades	Helpers and laborers
July to July:			
1969–70	11.6	11.4	12.5
1970–71	11.8	11.6	12.7
1971–72	6.4	6.6	5.4
1972–73	5.0	4.8	5.7
1973–74	7.8	7.6	9.1
1974–75	8.6	8.7	8.0
1975–76	6.5	6.5	6.6
1976–77	5.9	5.8	6.4
1977–78	5.7	5.7	5.8
1978–79	6.9	6.9	6.9

The highest regional increases during the 1978–79 period were reported in the Mountain States, 7.9 percent, and the Great Lakes, 7.8 percent. The latter region had the largest number of union building trades members. Outside of the Pacific States, 7.3 percent, increases in the remaining six regions were in the 6.0 to 6.2 percent range.

On July 2, 1979, hourly wage rates for all journeyman trades averaged $11.81, and for helpers and laborers, $9.15. The middle half of the wage rate array, excluding the upper and lower fourths, ranged from $10.99 to $12.68 per hour for journeymen, and from $8.52 to $10.11 per hour for helpers and laborers.

Regionally, average wage rates for journeymen were highest in the Pacific States, $12.73, and lowest in the Southeast, $10.20. Averages for helpers and laborers were also lowest in the Southeast, $6.89, and were highest in the Great Lakes States, $9.94.

Although less important than location, city population size also seemed to be related to average wage rates.[2] Journeymen in cities of at least 1 million inhabitants, for example, averaged 3 percent more per hour, or $12.28, than the $11.97 average of their counterparts in cities of 500,000 to 1 million; 6 percent more than the $11.62 average in cities of 250,000 to 500,000; and 8 percent more than the $11.36 average in cities of 100,000 to 250,000. There was, however, considerable variation among cities and individual trades in the same region and size group.

Employee benefits raised the journeymen's average to $14.59 and that of helpers and laborers to $11.26.[3] The proportion of employer contributions for these selected benefits to the basic wage-plus-benefit package has increased steadily during the 1970's, from about 10 percent in 1969 to nearly 20 percent in 1979.

On request, the Bureau or any of its regional offices will provide listings of union wage rates and employer payments for selected benefit funds, for each of the 66 cities studied, and for the Nation as a whole. A bulletin providing national, regional, and city averages, and wage trend data for each year since 1907 is in preparation. ☐

FOOTNOTES

---

[1] The survey was designed to reflect union wage rates in the 153 cities having 100,000 inhabitants or more, according to the 1970 Census of Population. Data were obtained from local union officials in 66 sample cities, by mail questionnaire, telephone, or personal interview by BLS field representatives.

Union wage rates are the basic (minimum) wage rates (excluding holiday, vacation, or other benefit payments made or regularly credited to the employee) agreed upon through collective bargaining between employers and unions. Averages do not include rates for apprentices or premium rates for overtime, or for work on weekends, holidays, or late shifts. Thus, they do not represent total hourly earnings of organized building trades workers.

[2] For a detailed discussion of the relative importance of city size and location in determining union building trade wage rates, see

Mark Sieling, "Union wage rates in building trades," *Monthly Labor Review*, July 1976.

[3] Data were collected on employer contributions to insurance (life, hospitalization, medical, surgical, and other similar types of health and welfare programs); pension funds; vacation payments; supplemental unemployment insurance; savings funds; and paid holidays, as provided for in labor-management contracts. In actual practice some employer payments are calculated on the bases of a negotiated rate, total hours worked, or gross payroll. Some contracts also provide for additional payments to other funds as for education and promotion; information on payments to these funds was not included in the survey averages.

Wage structure in steel mills narrows during 70's

The occupational pay structure in basic steel mills narrowed substantially during the 1970's, according to Bureau of Labor Statistics wage surveys, primarily because of uniform cents per hour wage increases for steelworkers, mostly those covered by labor-management contracts and paid under a common job evaluation system.

Between the last survey in February 1978, and May 1980, when the new master agreement became effective,[1] basic hourly wage rates for union workers rose 25 to 30 percent, depending on job class. The 27-month increase under both the old and new contracts included general wage advances of 55 cents per hour and cost-of-living adjustments totaling $1.47 per hour. Table 1 illustrates the narrowing such increases have had on the basic wage scales for selected occupations during the past 8 years. Scales for tandem-mill rollers, for example, were 44 percent above those of laborers in May 1980, compared with 80 percent in the September 1972 survey.

Table 1. Basic hourly wage scales and pay relatives for workers in selected occupations in steel mills with common job evaluation and pay systems[1]

Occupation	Typical job class	Basic wage scales[2]			Pay relatives[3]		
		Sept. 1972	Feb. 1978	May 1980	Sept. 1972	Feb. 1978	May 1980
Laborers	1	$3.520	$6.705	$8.725	100	100	100
Chargers (bar mills)	6	3.896	7.149	9.233	111	107	106
Locomotive engineers	11	4.366	7.704	9.868	124	115	113
Millwrights	16	4.836	8.259	10.503	137	123	120
First helpers (open hearth)	27	5.870	9.480	11.900	167	141	136
Tandem-mill rollers	32	6.340	10.035	12.535	180	154	144

[1] Includes establishments under common job evaluation and pay system, that is, with the same minimum hourly rates ($6.705 an hour) and the same increment (11.1 cents) between job classes.

[2] Includes cost-of-living adjustments.

[3] Basic wage scales of laborers = 100.

Narrower earnings also exist among individual workers in the industry, even though most are under incentive pay plans. The dispersion of earnings that commonly results from such plans was dampened substantially in recent years because most wage advances were not incorporated into the rates used for incentive calculations. For example, the incentive calculation rates for a job-class 9 locomotive craneman were nearly three-fourths of the basic hourly rate in 1972, compared to one-half in 1980. The overall industry compression can be measured by the relative index of wage dispersion, which declined from 24 in 1972 to 18 in 1978, one of the lowest figures for manufacturing industries studied by the Bureau.[2]

The primary reason for the concentration of earnings is the degree of uniformity built into the nationwide job evaluation system, applying to a large majority of the workers.[3] Slightly more than two-thirds of production workers were employed in establishments using a common job evaluation system, which has the same minimum rate and increment between job classes or labor grades. Under this system, all occupational classifications are assigned point values on the basis of factors such as experience, skill, responsibility, effort, and working conditions. These point values in turn, are related to one of the 34 established job classes.

At the least nine-tenths of production workers were in mills that provided various types of health and insurance benefits, pension plans, supplemental unemployment benefits, 11 paid holidays, regular paid vacations (up to 5 weeks after 25 years), and extended benefits every 5 years, that can bring total vacation pay to 14 weeks for "senior" personnel.

Slightly over one-fourth of the work force was employed on second shifts, and just over one-fifth, on third shifts. Pay differential for such shifts are 30 cents for evening and 45 cents for nightwork.

A summary of these findings was issued earlier and copies are available upon request from the Bureau of Labor Statistics or any of its regional offices. A comprehensive bulletin, *Industry Wage Survey: Basic Iron and Steel, 1978–79*, BLS Bulletin 2064, is also available. ☐

FOOTNOTES

[1] See May 1980 *Monthly Labor Review* for summary of provisions in the new basic steel agreements.

[2] The dispersion index is computed by dividing the difference between the first and third quartiles in the earnings array by the median.

Significant Decisions In Labor Cases

Supreme Court opens new term

On the opening day of its 1980–81 term, the Supreme Court agreed to review a lower court decision upholding the government standard limiting worker exposure to cotton dust.[1] Challenged by the textile industry as unreasonable and too costly, the Occupational Safety and Health Administration standard was ruled valid by the District of Columbia Circuit Court of Appeals, which found it technologically and economically feasible. The court reasoned that the cost of implementing an OSHA standard is feasible as long as the industry is not confronted with massive economic dislocation. This conflicts with interpretations of the Fifth, Sixth, and Seventh Circuits that some cost/benefit approach must be used to justify standards.[2]

The cotton dust case presents the first opportunity for the High Court to clarify the constraints on OSHA's regulatory authority[3] since striking down the agency's attempt to reduce worker exposure to benzene last term.[4] In the benzene case, the Court made clear that all OSHA standards must be "reasonably necessary" to remedy a "significant risk" to workers' health or safety. In ruling that the benzene standard failed to meet this criterion, the Court's split opinion revealed that "substantial proof" is required to identify a "significant risk" and suggested that the economic relationship between costs and benefits also should play some role in determining when a standard is reasonably necessary. Thus, a decision on the cotton dust standard should help clarify OSHA's burden of proof in setting workplace health and safety regulations and should settle other questions concerning the agency's options for implementing standards.

On opening day, the Court also agreed to decide whether a worker's right to file suit under the Fair Labor Standards Act remains intact following contractual grievance proceedings on the same claim.[5] In 1974, the Court ruled that initial resort to contractual grievance procedures to settle a workplace discrimination claim does not forfeit a worker's right to seek redress of the same claim under Title VII of the 1964 Civil Rights Act.[6]

In other opening-day action, the High Court summarily dismissed the appeals of lower court rulings that approved the voluntary use of racial quotas by a public employer and that upheld the constitutionality of a Federal requirement that State unemployment compensation laws cover all employees of State and local governments. The Court refused to review 72 other labor and labor-related cases on appeal from various lower courts. Unless four of the nine justices vote to review a case, review is denied, leaving the lower court ruling in effect.[7]

Quota questions

A public employer's use of voluntary racial quotas in hiring and promotion to remedy the effects of specifically identified discrimination was approved by the California Supreme Court in *Sacramento County Civil Service Commission*.[8] The California court pointed to portions of the Supreme Court's *Bakke* and *Weber* decisions[9] in reasoning that the temporary quotas, adopted after administrative proceedings had identified the effects of the county's discriminatory employment practices, do not violate Title VII of the 1964 Civil Rights Act or the equal protection guarantees of either State or Federal Constitutions. The California decision occurred before the Supreme Court ruled last term that Congress could remedy prior discrimination by imposing racial and ethnic quotas in allocating Federal money.[10] By dismissing the appeal of the California ruling, the Court permitted what amounts to an extension of the remedial authority used by Congress in *Fullilove* to public employers in California.

The constitutionality of preference schemes might be further clarified by another case from California the High Court has already agreed to review.[11] The California Department of Corrections adopted an affirmative action program that called for goals in the employment of women and minorities. The corrections department contended that such a program was necessary to ease tensions between employees and inmates. But white employees alleged that the department actually reserved job slots for women and minorities and that prior discrimination had not been established, violating the criteria for voluntary affirmative action programs established by the Supreme Court. The California Supreme Court refused to review a ruling by the California Court of Appeals that the corrections department's plan fell

within the boundaries set by the High Court's *Bakke* decision.

A Supreme Court Ruling in the California case could answer questions about what evidence of prior discrimination is necessary to sanction a voluntary affirmative action program, whether the safe and efficient operation of correctional facilities justifies certain percentages of women and minorities in the work force, and if such employment goals are permissible what reference group should be used to establish the target proportions.

The Court could soon act on appeals in two other cases that would also clarify the authority of public employers to utilize minority preference schemes. Both the Sixth Circuit and the Washington Supreme Court have approved the use of racial preference schemes by municipal employers which had first identified the effects of prior discrimination.[12]

States' rights, union duties

The Federal Unemployment Tax Act sets *voluntary* conditions for the application of State unemployment compensation laws. However, for private employers to obtain Federal tax credits in proportion to their payment to the State compensation program, the State law *must* conform to Federal requirements. One such requirement since 1976 extended coverage to all State and local government employees. Refusing to comply, New Hampshire challenged the consitutionality of the requirement, claiming that it involved the same impairment of State sovereignty disallowed by the Supreme Court in *National League of Cities.*[13] The First Circuit ruled that the voluntary nature of the Federal requirement for unemployment compensation coverage bore no similarity to the mandatory minimum wage issue raised in *National League of Cities* and therefore it did not violate the Constitution.[14] The Supreme Court dismissed New Hampshire's appeal of the First Circuit's ruling and denied review to an appeal of a similar decision by the District of Columbia appeals court in a case brought by the County of Los Angeles.[15]

The Supreme Court also refused to review a January 1980 ruling by the Eighth Circuit that a union breached its duty of fair representation when it processed the grievances of unsuccessful job bidders and failed to represent the less senior workers actually promoted.[16] The employer had promoted the less senior workers under contract language that permitted "skill and ability" to outweigh seniority in such decisions. After arbitration, the promotions were awarded to the more senior workers, and the union refused to process the grievances of those demoted. The appeals court ruled that, even though the union's policy of processing grievances on the basis of seniority was conducted in good faith, it illegally discriminated against employees promoted on the basis of merit. The court reasoned that such a practice may significantly alter the negotiated contract by challenging only those promotion decisions that are based on merit. The decision limits union discretion in using classifications such as seniority to select which grievances to process. □

Major Agreements Expiring Next Month

This list of collective bargaining agreements expiring in January is based on contracts on file in the Bureau's Office of Wages and Industrial Relations. The list includes agreements covering 1,000 workers or more.

Employer and location	Industry	Union[1]	Number of workers
Aldens, Inc. (Chicago, Ill.)	Retail trade	Teamsters (Ind.)	1,900
American Home Foods, Inc., Chef Boy-ar-dee Division (Milton, Pa.)	Food products	Food and Commercial Workers	1,300
American National Insurance Co. (Galveston, Tex.)	Insurance	Insurance Workers	3,850
Bryant Packing Co. (West Point, Mass.)	Food products	Food and Commercial Workers	1,200
Building Trades Employers Association Cement League and Building Contractors Association (New York, N.Y.)	Construction	Plasterers and Cement Masons	1,600
Corning Glass Works (Corning, N.Y.)	Stone, clay, and glass products	Flint Glass Workers	4,000
Del Monte Corp., Midwest Division (Illinois)	Food products	Retail, Wholesale and Department Store	1,450
Dow Jones and Co., Inc. (Interstate)	Printing and publishing	Independent Association of Publishers Employees, Inc. (Ind.)	1,100
Honeywell, Inc. (Minneapolis and St. Paul, Minn.)	Instruments	Teamsters (Ind.)	8,000
Kroger Co., Houston Division (Texas)	Retail trade	Food and Commercial Workers	2,400
Movers Association of Greater Chicago, Individual Employer (Illinois)	Trucking	Teamsters (Ind.)	1,000
Philadelphia Food Store Employer Labor Council (Pennsylvania)	Retail trade	Food and Commercial Workers	6,500
Shell Oil Co., Shell Chemical Co. (Houston, Tex.)	Petroleum	Oil, Chemical and Atomic Workers	2,250
Supermarkets, 6 companies (Georgia and Tennessee)[2]	Retail trade	Food and Commercial Workers	1,600
	Government activity	Employee organization[1]	
Michigan: Detroit Public Schools Custodial-Maintenance-Transportation Employees	Education	American Federation of State, County and Municipal Employees	2,400

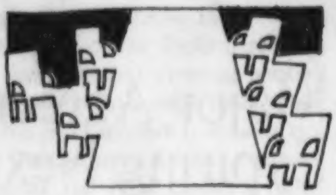
[1] Affiliated with AFL-CIO except where noted as independent (Ind.).

[2] Industry area (group of companies signing same contract).

Erratum

In George Iden's August 1980 article, "The labor force experience of black youth: a review," a typographical error resulted in the omission of a minus sign from two of the coefficients in the first column of table 3, page 13.

Developments in Industrial Relations



Stevens, Clothing Workers sign first agreement

J. P. Stevens & Co. and the Amalgamated Clothing and Textile Workers signed their first collective bargaining agreement, thereby easing one of the longest and most bitter confrontations in the history of labor-management relations in the United States. The agreement covers only 3,500 workers at 10 plants, but Stevens agreed to accept similar terms at any of its other plants that the union is able to organize within 18 months. However, during this period, the union agreed to give up its court-granted right to use company facilities for organizing purposes. J. P. Stevens, the second largest textile company in the industry, has a total of 70 plants and 44,000 workers.

AFL-CIO President Lane Kirkland called the victory "a tremendous forward step for the textile and apparel workers of the South." Clothing and Textile Workers' President Murray H. Finley, referring to the company claims that the union made the most significant concessions to attain the settlement, said his union "looks forward to more [such] victories by Stevens."

Whitney Stevens, chairman and chief executive officer of the company, said the settlement means that the union will no longer single out J. P. Stevens as its primary target. He claimed that the agreement would not spur unionization because, "people in the South basically don't care for unions," and acknowledged that the company plans to continue to resist organizing efforts in its nonunion plants.

Seven of the 10 plants involved in the settlement are located in Roanoke Rapids, N.C., and employ 3,000 of the covered workers. In 1974, the National Labor Relations Board had certified the results of a representation election the union had won earlier that year at the seven plants. Subsequent years did not produce a settlement, only union charges that Stevens had engaged in unfair labor practices, including refusal to bargain—charges that were ruled valid by the board and the courts. The union only recently gained representation rights at the other three plants through board elections or orders. These plants are in Allendale, S.C., High Point, N.C., and Boylston, Ala.

The 30-month contract for the Roanoke Rapids workers provided for an 8.5-percent pay increase effective immediately and 10.0 percent retroactive to July 1979. These increases matched those that the company gave workers in all other plants, but had withheld from the Roanoke Rapids workers "as a contract bargaining measure," according to company officials. The union said the 1980 increase brought the average straight-time pay rate at the 10 plants to more than $5 an hour. The contracts are subject to reopening during their term on wages and benefits.

All of the contracts provided for the following terms considered favorable to the union: checkoff of union dues from payroll; various changes in health and safety practices; binding arbitration of disputes that arise between contract settlements; "regulation" of work loads; a seniority system to govern layoffs and promotions; and company assurances that it would not retaliate against employees who engage in union activities.

Provisions viewed as favorable to Stevens called for an end to the union's designation of Stevens as its primary organizing target; termination of the consumer boycott against Stevens products that the union had initiated in 1976; and an 18-month suspension of the union's campaign to pressure and embarrass directors of other companies serving on Stevens' board of directors and Stevens' officers serving on other boards. Reportedly, the settlement was hastened by the union's plan to attempt to gain two seats on the board of Metropolitan Life Insurance Co., Stevens' major lender. This led Metropolitan to express concern to Stevens over the adverse publicity and the estimated $7 million cost associated with a contested election.

Boeing and Machinists reach accord

The first settlement in the round of bargaining in the aerospace industry occurred when the Boeing Co. and the Machinists union agreed to a 3-year contract for 50,000 employees in Seattle, Wash., Wichita, Kans., Portland, Oreg., and other locations.

The union valued the wage and benefit package at $3.85 an hour, or a 39-percent increase over the term, in-

---

"Developments in Industrial Relations" is prepared by George Ruben and other members of the staff of the Division of Trends in Employee Compensation, Bureau of Labor Statistics, and is largely based on information from secondary sources.

cluding wage escalator adjustments based on an estimated 10-percent annual rise in the Consumer Price Index.

Wages will increase by 7 percent immediately, and 3-percent increases are scheduled on the first and second anniversaries. In addition, workers in the top 11 pay grades received an "inequity adjustment" of 1 to 35 cents an hour. The wage escalator clause was not changed; it provides 1-cent-an-hour quarterly adjustments for each 0.3-point movement in the Consumer Price Index for Urban Wage Earners and Clerical Workers (1967 = 100).

Pensions for future retirees were increased to $16 a month for each year of credited service after December 31, 1980, and the existing $14 rate will now apply to all past years. Under the prior contract, the rate was $12 for each year of service through January 1978 and $14 for each year thereafter.

Retirees' pensions also were increased by $1 a month for each year of service or 1 percent of their total monthly entitlement, whichever is more. Employees are now permitted to retire at unreduced benefit rates at age 60, instead of age 62, and benefits for early retirement (at age 58) will be computed at 94 percent of the normal rate, instead of the previous 86 percent.

Health and welfare improvements included the establishment of an alcoholic rehabilitation program and a hearing aid plan, extension of the dental plan to provide orthodontic coverage for dependents under age 19, and an increase in the amount payable for major medical expenses.

Later, the Machinists union settled with Lockheed Corp. on similar terms for 31,000 workers in Burbank and Sunnyvale, Calif., and Marietta, Ga. Also, the United Auto Workers negotiated a similar contract with McDonnell Douglas Corp. for 15,000 workers in Long Beach, Calif., Tulsa, Okla., and Melbourne, Ark.

Meanwhile, the Machinists and Auto Workers unions, which coordinate their bargaining efforts in the aerospace and other industries, began merger talks that could result in the Nation's largest union, with more than 2.3 million members. The two unions have been suffering declines in membership because of economic conditions and are in the midst of efforts to cut operating costs.

American Motors, Auto Workers settle

Continuing the practice of recent years, American Motors Corp. and the United Auto Workers negotiated a 3-year contract that provided for some cost concessions from the pattern the union negotiated with General Motors Corp. and Ford Motor Co. in 1979. (See *Monthly Labor Review*, November 1979 pp. 58–59, for the GM and Ford terms and *Monthly Labor Review*, March 1980, p. 56, for the terms at Chrysler Corp., which also deviated from GM and Ford.) Following the lead of Chrysler Corp., American Motors agreed to nominate an official of the union to its board of directors, pending approval from the Federal Government. However, the company reportedly is concerned that having a union representative on its board might violate the rule that a board member's responsibility is to represent the interests of stockholders.

Raymond Majerus, the union's secretary-treasurer and director if its American Motors department, said that pension improvements will lag the GM pattern during the first two contract years, but in the final year will attain parity with the GM contract. (The GM, Ford, and Chrysler agreements expire in September 1982 and the American Motors agreement expire a year later.)

According to Majerus, 14 cents of the 24 cents cost-of-living allowance at American Motors was diverted to help the company meet the cost of benefits improvements. (GM withheld 14 cents by reducing each of the quarterly cost-of-living increases by 1 or 2 cents an hour.) American Motors and the union also agreed to revise the escalator formula to 1 cent for each 0.26 point movement in the consumer price index. This formula is effective beginning with the quarterly adjustment in June 1983 and is retroactive to December 1981. (At GM, the formula is to be effective with the quarterly adjustment in December 1981.) "Set" wage increases at American Motors were the same as those at GM—3 percent at the beginning of each contract year and an additional 24-cent increase in the first year.

The final concession at American Motors was in the number of paid personal holidays, which was raised to a total of 23, from 15, to be taken during three calendar years. (At GM, the total was raised from 15 to 26.)

The American Motors accord was preceded by a 2-day strike by the 8,800 hourly employees the United Auto Workers union represents in Kenosha and Milwaukee, Wisc.

Clothing workers accept short-term contract

In a departure from their practice in recent years, the Amalgamated Clothing and Textile Workers and the Clothing Manufacturers of America negotiated a contract that extends for only 18 months. The previous 40-month contract expired on September 30, the day of the new settlement. The parties agreed that the depressed state of the men's and boys' tailored clothing industry and concern over the rate of inflation were the major factors in the shorter duration. The 18-month term was a compromise between the union's demand for either a 1-year contract or a 3-year agreement with an uncapped cost-of-living clause, and management's proposal for a 3-year contract with a capped escalator.

The accord, which covered 80,000 workers, provided for wage increases of 30 cents an hour on October 1, 1980, and 20 cents on March 1 and October 1 of 1981. Also, on October 1, 1981, employees may receive an escalator increase—not to exceed 10 cents—calculated at 6 cents for each percentage point rise in the Consumer Price Index above 9.1 percent for the year ending June 1981. The previous contract provided for increases of $1.10 an hour over the 40 months and also resulted in a 10-cent escalator increase in 1979.

There were numerous changes in insurance coverage. Employer financing of health and welfare and pension benefits remained at 15 percent of payroll, but .4 of a percentage point more of the money will be allocated for pensions.

There was no immediate change in the vacation schedules—all employees with at least 1 year of service receive 3 weeks of paid vacation each year. However, the parties agreed that the contract to be negotiated in 1982 will give 20-year employees 4 weeks of annual vacation.

Federal white-collar workers get pay increase

The 1.4 million white-collar employees covered by the General Schedule pay system received a 9.1-percent salary increase in October, after earlier indications that the increase would be smaller. (About 25,000 employees in the two lowest pay grades received 10.1- or 10.4-percent increases.) In January, President Jimmy Carter had projected a 6.2-percent increase; this was changed to 7.8 percent in July. The President said the figure was increased to 9.1 percent because "Federal employees face the same kinds of problems with inflation as other citizens and should not have to bear an unfair burden."

The President's pay agent—the Director of the Office of Personnel Management, the Director of the Office of Management and Budget, and the Secretary of Labor—announced that an increase ranging from 10.12 percent for employees in the lowest pay grade to 20.91 for those in grade 15 would be required to attain comparability with equivalent occupations in the private economy. The average increase would have been 13.46 percent. However, the President used his authority under the Federal Pay Comparability Act of 1970 to propose the 9.1-percent increase, which matched the March 1979 to March 1980 rise in private sector salaries covered in the Bureau of Labor Statistics' annual survey of professional, administrative, technical, and clerical pay. Either the House of Representatives or the Senate could have rejected the proposal and the President would have then been obligated to implement an increase in accord with the comparability principle—presumably, the increase recommended by his pay agent—but the Congress did not act.

Some employees in the upper length-of-service pay steps of grade 15 either did not receive the increase or received only part of it because, by law, they cannot exceed the $50,112.50-a-year salary of presidential appointees at the lowest level of the Executive Schedule. This also precluded any increase for employees in GS grades 16, 17, and 18, and for those in the Senior Executive Service, established under the Civil Service Reform Act of 1978.

Under the Executive Salary Cost-of-Living Adjustment Act of 1975, members of the Congress, Executive Schedule personnel, and Federal judges would have automatically received the 9.1-percent increase—which would have resulted in a matching increase for the government employees at the $50,112.50 limit. However, the Congress had voted earlier to forgo this year's increase.

The 9.1-percent increase also applied to members of the Foreign Service and members of the medical and dental staffs of the Veterans' Administration under existing laws linking their salary levels to those of General Schedule employees. A similar linkage usually applies to the 2 million members of the Armed Forces, but the Congress legislated a more costly compensation package intended to make military service more attractive. The package, effective in October, included an 11.7-percent pay increase; a $20,000-ceiling on re-enlistment bonuses (formerly $15,000); a 15-percent increase in sea pay and a 25-percent increase in flight pay; increases in subsistence and housing allowances; increased travel expenses; and increased living expenses in high-cost areas and for temporary assignments.

Pay for the Government's 465,000 blue-collar workers is adjusted annually at various times throughout the year, based on comparisons with prevailing local pay rates for the same occupation in the private economy. However, special legislation and a presidential order limited the blue-collar employees increases to 7 percent during the fiscal year that ended September 30, 1980. A similar 9.1-percent limit applies during the current fiscal year.

Postal Workers' president loses re-election bid

Morris Biller won a 2-year term as president of the Postal Workers, defeating incumbent president Emmet Andrews and two other officers of the union in a mail referendum. Biller, who was head of the union's local in New York City, received 45,049 votes and Andrews, 26,025. William Burrus of Cleveland, running on the Biller slate, was elected executive vice president. Secretary-treasurer Chester W. Parrish retained his post in the voting, which involved 93 positions in the union.

Andrews became president of the union in 1977 after the death of Francis S. Filbey, and was elected to his first full term in 1978.

Steelworkers' local retracts offer of pay reduction

Local 2869 of the Steelworkers retracted its offer to accept a $1-an-hour reduction in future cost-of-living increases from Kaiser Steel Corp., leading to renewed speculation about the future of the company's mill in Fontana, Calif., which lost $39 million in 1979. Earlier, the company had announced plans to keep the mill open, calling the local's move to aid the company an important factor in the decision. Kaiser officials attributed the withdrawal of the offer to the international leaders of the Steelworkers.

The decision was an "effort to avoid any future conflict in regard to the alleged legalities in the matter of this local union's recent vote . . . and to maintain the union's integrity," according to the union. The concession would have been accomplished by withholding the first 10 cents of each of the next 10 quarterly cost-of-living adjustments.

Kaiser officials attributed the mill's difficulties to competition from Japanese steelmakers, to operating problems, and to the depressed state of the steel market. They welcomed the union's pledge to "seek out, discuss and implement all feasible ways to . . . make Kaiser Steel Corp. more competitive." In recent months, Kaiser has laid off 2,000 of its 6,000 hourly workers and cut production to 2.8 million tons a year, from 3.5 million tons.

California wine workers end strike

A threat to the 1980 vintage in the California wine industry ended when members of the Winery, Distillery and Allied Workers Union approved a 3-year contract with the Winery Employers Association and ended their first strike in 35 years. The walkout was first limited to two of the largest wineries but then spread to all 23 wineries. The employers said they continued production during the stoppage by using supervisory employees.

The settlement came only about a week before the peak of the grape picking and crushing period. It provided for yearly wage increases of 13, 8, and 7 percent, bringing average pay to about $11 an hour, from about $8.39. (This includes an estimated 18 cents increase under the escalator clause, which was continued.)

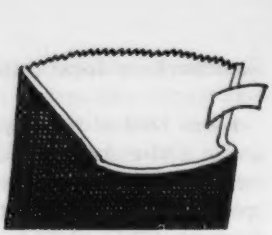
The wineries are located in the Napa and Central valleys of California and produce 80 percent of the State's wine. The State, in turn, accounts for 80 percent of the Nation's wine.

Industry withdraws coke emission exposure suit

The long legal fight over the Occupational Safety and Health Administration's limits on worker exposure to coke oven emissions ended when the steel industry withdrew the appeal it had filed with the Supreme Court. Sheldon Wesson, speaking for the American Iron and Steel Institute, said the case had become almost moot because companies have already instituted most of the protective measures called for by the standard during the series of appeals that followed OSHA's announcement of the standard in 1977. According to OSHA, the standard is needed to reduce an excessive rate of cancer for 21,000 coke oven workers. The industry had contended that the standard could not be met in many instances.

In another occupational safety and health case, General Motors Corp. announced that it will undertake a year-long study to determine why employees and retirees from its Flint (Mich.) trim plant suffer a high rate of lung cancer. The company said it decided on the study after the Sloan Kettering Cancer Center confirmed earlier findings of the United Auto Workers that the rate of lung cancer deaths for the employees and retirees exceeded the national average.

Earlier, General Motors had announced that it was underwriting the largest industrial health screening in history, aimed at finding the causes of rectal and colon cancer in men and women who build scale models of cars from wood, clay, and other materials. (See *Monthly Labor Review*, April 1980, p. 63.) ☐



Book Reviews

Labor relations: room for research

The Labor Relations Process. By William H. Holley, Jr. and Kenneth M. Jennings. Hinsdale, Ill., The Dryden Press, A division of Holt, Rinehart and Winston, 1980. 656 pp. $19.95.

This volume, by William H. Holley, Jr. and Kenneth M. Jennings, is designed as a text for college courses in industrial relations. The authors state that the book combines "theoretical and practical insights" into the labor relations process; that it was "written with both the beginning student and the professional scholar" in mind; that each of its sections "has been subjected to critical academic and practitioner review"; and that the extensive references at the end of each chapter are intended "as useful stimuli and starting points for continuing research on the subject."

Somehow the performance is not quite up to the promise. It may be that the authors had too many objectives in view, and that their large accumulation of information, which is impressive, could not be sufficiently digested and fitted into the framework of their analysis. The analytical framework itself is unexceptionable. It is based on the first chapter of John Dunlop's *Industrial Relations Systems* (1958), in which the essence of the industrial relations process is found in the establishment and administration of work rules relating to pay, benefits, and other conditions of employment. These rules are shaped under various conditions and constraints by the "actors" in the system—workers and their formal or informal organizations; managers and their organizations; and the representatives of appropriate government administrative or rule-making agencies.

The present book is divided into four parts. The initial chapter of part 1 consists largely of an adaptation of the Dunlop model of the industrial relations process, but with scant attention to the constraints imposed upon the actors in the system by conditions in the relevant product and labor markets. There is also a discussion of why workers join unions. In between consideration of "alienation" *(Marx)* and "job scarcity" *(Perlman)* as possible reasons for union membership is the statement—perhaps undergraduates need to be told this—that "Some research has shown that employees might join unions if they (a) are dissatisfied with physical characteristics of the workplace, low wages, or lack of benefits and (b) believe that a union will help them achieve the job-related conditions important to them."

The remainder of part 1 (chapters 2–5) deals with the development of the labor movement in the United States; major legal decisions and legislative enactments affecting labor relations; how unions are organized (largely restricted to the certification procedures of the National Labor Relations Board, with some attention to employer antiunion tactics); and to the structure of the trade union movement, including a brief discussion of union membership.

There are quite a few points relating to these chapters that cannot be raised in a brief review, however, one broad question suggests itself, but not with respect to this book alone. It is this: why should not more research attention be devoted to employer associations with bargaining functions and indeed to the policies, procedures, and tactics of major employers who bargain independently? So far as I know, the most recent full-scale study of employer bargaining associations was published almost 60 years ago (Clarence E. Bonnett, *Employers' Associations in the United States,* 1922). Bonnett at that time pointed to the lack of information on the bargaining and related activities of employer organizations. The trade union movement might well complain of the disproportionate attention given to its side of the bargaining relationship.

Part 2 (chapters 6–9) is concerned with the negotiation of collective bargaining agreements; methods of

resolving impasses, including mediation, interest arbitration, and work stoppages; and with contract administration, with emphasis upon grievance procedures and the development of grievance arbitration. This is followed in part 3 (chapters 10–13) by a discussion of major issues that tend to arise in the collective bargaining process, including managerial prerogatives, union security, employee discipline, job security, and worker compensation.

These chapters are uneven, the strongest being those dealing essentially with a single subject (for example, grievance arbitration, employee discipline). A general weakness is the absence at many points of much in the way of analysis, coupled with a tendency to throw all kinds of odds and ends of information into the narrative. This is shown, perhaps to an exaggerated extent, in the chapter on economic issues. For example, industry wage differentials sometimes enter into collective bargaining, but the discussion in chapter 13 throws no light on the matter. The section on job evaluation as it relates to collective bargaining is confusing. There is no coherent analysis of the factors that influence decisions on general wage changes. With respect to cost-of-living escalator clauses, it is stated in the same paragraph that the most common formula for adjustment "is cents per hour for each point increase in the CPI" and also that the "most common arrangement is to have wages adjusted for each 0.3-percent change in the CPI." Neither of these statements is correct.

Part 4 (chapters 14–17) covers a variety of situations that are designated as emerging labor relations processes. One chapter deals with State and local government, with special emphasis upon collective bargaining at educational institutions; another with the development of collective bargaining in the Federal sector. This is followed by a brief account of industrial relations systems in other parts of the world, with some consideration of problems of transnational collective bargaining with multinational corporations. The final chapter considers collective bargaining in professional sports (baseball in some detail); health care (particularly for nurses); and agriculture. At the end of the volume, summaries of a number of cases dealing with various aspects of the industrial relations process decided by the National Labor Relations Board and private arbitrators, with the decisions not indicated, are set forth for class discussion.

Clearly this volume contains a great deal of information. It cannot be used uncritically as a text. Its usefulness will depend heavily upon the extent to which the instructor brings skill and knowledge to bear upon its subject matter.

Opening the managerial ranks to women

Selecting, Developing, and Retaining Women Executives: A Corporate Strategy for the Eighties. By Helen J. McLane. New York, Litton Educational Publishing, Inc., 1980. 248 pp., bibliography. $14.95, Van Nostrand Reinhold Co., New York.

The labor force participation of women has grown substantially over the last decade and, today, more than half of all women are working or looking for work. Currently, women make up 42 percent of the labor force and, not surprisingly, most are crowded into a narrow range of lower paying, less desirable occupations. More than half of all women are engaged in either clerical or service work. Even when women have professional careers, they are often slotted into nonsupervisory and technical roles, rather than managerial positions which lead to the apex of the corporate pyramid. Yet, the aspirations of women to be managers and leaders is rising. Past practices have allowed few women in management, but present laws and government policies, most notably, affirmative action and equal opportunity, are requiring that changes be made in the hiring and advancement of women.

The introduction of women into mid- and upper-level managerial ranks is by no means a simple task. There are psychological and sociological barriers confronting women which make this endeavor difficult. In this book, Helen J. McLane focuses on management's task of successfully integrating women into the corporate hierarchy.

Probably the biggest mistake made in selecting a woman for a key managerial position is the failure to consider whether her personal characteristics are appropriate to the organization. In other words, the interviewer must determine if the potential woman executive is qualified not only in terms of her education and experience but that her personality, attitude, and life style do not conflict with the company's projected self-image. This evaluation is not something that occurs exclusively when considering a woman candidate; however, in their eagerness to hire women, many companies tend to overlook the need to match personalities.

It is not surprising to learn that the attitude of the woman executive's male peers often creates the biggest barrier and source of discouragement for women moving into the managerial ranks. The author points out a number of steps an organization can take to help assure the successful integration of a woman into management. First, the job should be a substantive position and not a post created for her. Second, the organization should judge her performance by clearly defined and readily measurable standards, the same standards by which others are judged. Last, the company should commit itself to providing the support that a woman will need if she is to succeed. The message is clear; little overall progress will be made in advancing women without consistent and committed leadership from top management. Developing a climate for change of policies and practices in order to accept women as managers usually means revising some organizational procedures and many attitudes and relationships. And while the company must avoid being overprotective of women, female managers must be allowed to take risks and they must be allowed the opportunity to fail.

What do managerial and professional women want? McLane states it succinctly when she notes that women "basically want the same things as men: responsibility, challenge, opportunity for advancement, and appropriate compensation." Women want to be treated as individuals and not as stereotypical women. They seek evaluation on merit, not on sex.

In summation, the book offers advice on every matter concerning the recruitment, selection, hiring, development, positioning, and retention of women executives. In fact, its major inadequacy is in effectively separating one chapter from the next. The book would have benefited from an overall tightening of its content and a reduction in the use of personal interest stories which, after a while, tend to belabor the point rather than enhance it. The only other area for concern, in an otherwise fine presentation of management's goals, was the careless inclusion of a statement in which she reports that "three-fourths of all woman workers remain in five female occupations: secretary-stenographer, household worker, bookkeeper, elementary teacher, and waitress." While women are indeed concentrated in these occupations, they account for only 20 percent of the jobs held by women. In fact, an additional 20 percent of all women are engaged in managerial and professional occupations, but as McLane so aptly points out, they are concentrated in the technical-professional path that is likely to go to the lower middle-management level of the organization and not the more general managerial path leading all the way to top management.

Will there be enough?

Uncertain Futures: Challenges for Decision-Makers. By Robert U. Ayres. New York, John Wiley & Sons, 1979. 429 pp. $16.95.

Built on Robert U. Ayres previous publications on interrelationships between resources and environment and on alternatives to the combustion engine, this book attempts to present a more global picture of national and international future resources and their economic, technological, and political implications. The author's objective is to provide the reader with a balanced assessment of likely futures in terms of both technological feasibility and social likelihood. The book does not place much accent on technical questions related to specific types and models of long-term forecasting, nor on detailed underlying theories of long-term technological and economic development. Rather, the author attempts to link qualitative and quantitative reasoning, different strands of thought, alpha and omega (conservative and revolutionary) methods, along with social and technological emphasis to yield a comprehensive overall picture of possible futures, mainly those pertaining to the United States.

After a brief, cursory, (and perhaps coarse) introductory chapter, which deals with issues of forecasting methodology written for the novice in this field, the author discusses various measures of man and projection, future natural resources, ecological development, and comparative advantage.

The central idea of unraveling our possible future via various measures of man is an innovative approach. Given the expertise required in a number of disciplines, it is understandable that some areas of the book are better documented and presented than others. This becomes evident in the chapters on measures of man which discuss competing social values, demographic and international developments, which, apart from a few references to prior work in sociology and political science, employ a fair amount of stereotypes and mere classifications of social and personal value systems and ideologies, as opposed to more thorough discussions of factors facilitating, limiting, or constraining future economic and technological developments.

The depth of the discussion and documentation of supporting evidence change considerably in the chapters which deal with microeconomic forecasts in key sectors, the general environment of technological change, diffusion of technological change, and the future resource environment.

The first of these chapters provides an overview of likely patterns of future consumption in food, energy, materials, and services based both on conventional extrapolations and, more importantly, on likely technological and developmental changes underlying these growth processes. The provision of international comparative data throughout offers a good contextual frame against which to analyze and compare U.S. consumption patterns.

The chapters on technology are helpful in showing both the underlying rationale and dynamics of technological change, and the nature of substitution processes for a number of materials and technologies.

In the chapter on the future resource environment, the author discusses factors which may or may not limit future growth in terms of physical resources, including an account of the interrelationships between energy consumption and climate.

The last chapter illustrates the consequences of nuclear proliferation, another energy crisis, or a dramatic worsening of world food supplies.

This book will prove to be an indispensable and thought-provoking source to those readers who are more interested in the illustration of possible future environments than in who is right or wrong about the future.

Making the marriage work too

Making It Together as a Two-Career Couple. By Marjorie Hansen Shaevitz and Morton H. Shaevitz. Boston, Mass., Houghton Mifflin Co., 1980. 282 pp. $8.95.

As social and economic changes swept across the United States in the 1960's and 1970's, Americans found themselves altering their institutions and their lives in an effort to keep up with, if not always ahead of, the effects of their shifting personal and financial fortunes. Certainly, the American family, as an institution, has not remained invulnerable to change, and one of the largest changes overtaking it has been the emergence of women from the home and into the workplace. According to the Bureau of Labor Statistics, by 1979 there were 18.7 million married-couple families with two wage earners or more; this book was written with those families in mind.

The authors, Marjorie Hansen Shaevitz and Morton H. Shaevitz, are codirectors of the Institute for Family and Work Relationships in La Jolla, Calif., and have been working with two-career couples for the last 8 years. They contend that until recently, couples who have faced career changes, reassignments, income disruption, and other facts of modern worklife, received little or no support from a community that was still primarily one wage-earner oriented. To help such couples, the authors offer advice on how to cope with the problems that can arise from a two-career relationship as well as how to deal with the minor day-to-day struggles of home maintenance in a busy household.

Half the book is devoted to advice about practical matters such as: choosing proper child care; finances; personal health care; and parental responsibilities as they relate to a working couple. A sample of subchapter headings finds information about Managing Your Time, Child Care Outside Your Home, and Costs in Earning Second Income. Unfortunately, most of the financial advice does not bear directly on the finances of two-career couples and has already been given in other popularly available "money books."

The second half of the book deals with serious career issues. The authors are firm believers in shared career decisionmaking and the sections dealing with work as it affects the two-career couple are realistic and fair. Lists of job-rating factors with instructions on how to weigh various items such as geographical area, personal goals, and economic costs are included to help readers in their decisionmaking. Even more helpful are the case histories of couples dealing with their own work-related dilemmas. Couples who have been counseled by the authors relate their two-career problems and solutions in their own words, which helps readers, who may themselves be facing the prospect of saying "No" to a transfer or some other stressful job-related situation, realize that they are not alone.

The authors emphasize that this book is for working couples, not about them. And although it may not suit every couple's needs, it does give the working couple a handy reference guide for almost every question larger than "Who takes out the garbage?"

37. Work stoppages, 1947 to date 116

NOTES ON CURRENT LABOR STATISTICS

This section of the *Review* presents the principal statistical series collected and calculated by the Bureau of Labor Statistics. A brief introduction to each group of tables provides definitions, notes on the data, sources, and other material usually found in footnotes.

Readers who need additional information are invited to consult the BLS regional offices listed on the inside front cover of this issue of the *Review*. Some general notes applicable to several series are given below.

Seasonal adjustment. Certain monthly and quarterly data are adjusted to eliminate the effect of such factors as climatic conditions, industry production schedules, opening and closing of schools, holiday buying periods, and vacation practices, which might otherwise mask short-term movements of the statistical series. Tables containing these data are identified as "seasonally adjusted." Seasonal effects are estimated on the basis of past experience. When new seasonal factors are computed each year, revisions may affect seasonally adjusted data for several preceding years. For a technical discussion of the method used to make seasonal adjustments, see *X-11 Variant of the Census Method II Seasonal Adjustment Program*, Technical Paper No. 15 (Bureau of the Census, 1967).

Seasonally adjusted labor force data in tables 2–7 were last revised in the February 1980 issue of the *Review* to reflect the preceding year's experience. Beginning in January 1980, the BLS introduced two major modifications in the seasonal adjustment methodology for labor force data. First, the data are being seasonally adjusted with a new procedure called X-11/ARIMA, which was developed at Statistics Canada as an extension of the standard X-11 method. A detailed description of the procedure appears in *The X-11 ARIMA Seasonal Adjustment Method* by Estela Bee Dagum (Statistics Canada Catalogue No. 12-564E, September 1979). The second change is that seasonal factors are now being calculated for use during the first 6 months of the year, rather than for the entire year, and then are calculated at mid-year for the July-December period. Revisions of historical data continue to be made only at the end of each calendar year.

Annual revision of the seasonally adjusted payroll data in tables 11, 13, 16, and 18 begins with the August 1980 issue using the X-11 ARIMA seasonal adjustment methodology. New seasonal factors for productivity data in tables 33 and 34 are usually introduced in the September issue. Seasonally adjusted indexes and percent changes from month to month and from quarter to quarter are published for numerous Consumer and Producer Price Index series. However, seasonally adjusted indexes are not published for the U.S. average All Items CPI. Only seasonally adjusted percent changes are available for this series.

Adjustments for price changes. Some data are adjusted to eliminate the effect of changes in price. These adjustments are made by dividing current dollar values by the Consumer Price Index or the appropriate component of the index, then multiplying by 100. For example, given a current hourly wage rate of $3 and a current price index number of 150, where 1967 = 100, the hourly rate expressed in 1967 dollars is $2 ($3/150 × 100 = $2). The resulting values are described as "real," "constant," or "1967" dollars.

Availability of information. Data that supplement the tables in this section are published by the Bureau of Labor Statistics in a variety of sources. Press releases provide the latest statistical information published by the Bureau; the major recurring releases are published according to the schedule given below. The *Handbook of Labor Statistics 1978*, Bulletin 2000, provides more detailed data and greater historical coverage for most of the statistical series presented in the *Monthly Labor Review*. More information from the household and establishment surveys is provided in *Employment and Earnings*, a monthly publication of the Bureau, and in two comprehensive data books issued annually—*Employment and Earnings, United States* and *Employment and Earnings, States and Areas*. More detailed information on wages and other aspects of collective bargaining appears in the monthly periodical, *Current Wage Developments*. More detailed price information is published each month in the periodicals, the *CPI Detailed Report* and *Producer Prices and Price Indexes*.

Symbols

p = preliminary. To improve the timeliness of some series, preliminary figures are issued based on representative but incomplete returns.

r = revised. Generally this revision reflects the availability of later data but may also reflect other adjustments.

n.e.c. = not elsewhere classified.

Schedule of release dates for major BLS statistical series

Title and frequency (monthly except where indicated)	Release date	Period covered	Release date	Period covered	MLR table number
Employment situation	December 5	November	January 9	December	1–11
Producer Price Index	December 5	November	January 9	December	26–30
Consumer Price Index	December 23	November	January 23	December	22–25
Real earnings	December 23	November	January 23	December	14–20
Work stoppages	December 30	November	January 29	December	37
Labor turnover in manufacturing	December 31	November	January 30	December	12–13
Major collective bargaining settlements (quarterly)	...	...	January 29	1980	35–36

EMPLOYMENT DATA FROM THE HOUSEHOLD SURVEY

EMPLOYMENT DATA in this section are obtained from the Current Population Survey, a program of personal interviews conducted monthly by the Bureau of the Census for the Bureau of Labor Statistics. The sample consists of about 65,000 households beginning in January 1980, selected to represent the U.S. population 16 years of age and older. Households are interviewed on a rotating basis, so that three-fourths of the sample is the same for any 2 consecutive months.

Definitions

Employed persons are (1) those who worked for pay any time during the week which includes the 12th day of the month or who worked unpaid for 15 hours or more in a family-operated enterprise and (2) those who were temporarily absent from their regular jobs because of illness, vacation, industrial dispute, or similar reasons. A person working at more than one job is counted only in the job at which he or she worked the greatest number of hours.

Unemployed persons are those who did not work during the survey week, but were available for work except for temporary illness and had looked for jobs within the preceding 4 weeks. Persons who did not look for work because they were on layoff or waiting to start new jobs within the next 30 days are also counted among the unemployed. The **unemployment rate** represents the number unemployed as a percent of the civilian labor force.

The **civilian labor force** consists of all employed or unemployed persons in the civilian noninstitutional population; the **total labor force** includes military personnel. Persons **not in the labor force** are those not classified as employed or unemployed; this group includes persons retired, those engaged in their own housework, those not working while attending school, those unable to work because of longterm illness, those discouraged from seeking work because of personal or job market factors, and those who are voluntarily idle. The **noninstitutional population** comprises all persons 16 years of age and older who are not inmates of penal or mental institutions, sanitariums, or homes for the aged, infirm, or needy.

Full-time workers are those employed at least 35 hours a week; **part-time workers** are those who work fewer hours. Workers on part-time schedules for economic reasons (such as slack work, terminating or starting a job during the week, material shortages, or inability to find full-time work) are among those counted as being on full-time status, under the assumption that they would be working full time if conditions permitted. The survey classifies unemployed persons in full-time or part-time status by their reported preferences for full-time or part-time work.

Notes on the data

From time to time, and especially after a decennial census, adjustments are made in the Current Population Survey figures to correct for estimating errors during the preceding years. These adjustments affect the comparability of historical data presented in table 1. A description of these adjustments and their effect on the various data series appear in the Explanatory Notes of *Employment and Earnings.*

Data in tables 2–7 are seasonally adjusted, based on the seasonal experience through December 1979.

1. Employment status of the noninstitutional population, 16 years and over, selected years, 1950–79

NOTE: The monthly data in these tables have been revised to reflect seasonal experience through 1979.

EMPLOYMENT, HOURS, AND EARNINGS DATA FROM ESTABLISHMENT SURVEYS

EMPLOYMENT, HOURS, AND EARNINGS DATA in this section are compiled from payroll records reported monthly on a voluntary basis to the Bureau of Labor Statistics and its cooperating State agencies by 166,000 establishments representing all industries except agriculture. In most industries, the sampling probabilities are based on the size of the establishment; most large establishments are therefore in the sample. (An establishment is not necessarily a firm; it may be a branch plant, for example, or warehouse.) Self-employed persons and others not on a regular civilian payroll are outside the scope of the survey because they are excluded from establishment records. This largely accounts for the difference in employment figures between the household and establishment surveys.

LABOR TURNOVER DATA in this section are compiled from personnel records reported monthly on a voluntary basis to the Bureau of Labor Statistics and its cooperating State agencies. A sample of 40,000 establishments represents all industries in the manufacturing and mining sectors of the economy.

Definitions

Employed persons are all persons who received pay (including holiday and sick pay) for any part of the payroll period including the 12th of the month. Persons holding more than one job (about 5 percent of all persons in the labor force) are counted in each establishment which reports them.

Production workers in manufacturing include blue-collar worker supervisors and all nonsupervisory workers closely associated with production operations. Those workers mentioned in tables 14–20 include production workers in manufacturing and mining; construction workers in construction; and nonsupervisory workers in transportation and public utilities, in wholesale and retail trade, in finance, insurance, and real estate, and in services industries. These groups account for about four-fifths of the total employment on private nonagricultural payrolls.

Earnings are the payments production or nonsupervisory workers receive during the survey period, including premium pay for overtime or late-shift work but excluding irregular bonuses and other special payments. **Real earnings** are earnings adjusted to eliminate the effects of price change. The **Hourly Earnings Index** is calculated from average hourly earnings data adjusted to exclude the effects of two types of changes that are unrelated to underlying wage-rate developments: fluctuations in overtime premiums in manufacturing (the only sector for which overtime data are available) and the effects of changes and seasonal factors in the proportion of workers in high-wage and low-wage industries. **Spendable earnings** are earnings from which estimated social security and Federal income taxes have been deducted. The Bureau of Labor Statistics computes spendable earnings from gross weekly earnings for only two illustrative cases: (1) a worker with no dependents and (2) a married worker with three dependents.

Hours represent the average weekly hours of production or nonsupervisory workers for which pay was received and are different from standard or scheduled hours. **Overtime hours** represent the portion of gross average weekly hours which were in excess of regular hours and for which overtime premiums were paid.

Labor turnover is the movement of all wage and salary workers from one employment status to another. **Accession rates** indicate the average number of persons added to a payroll in a given period per 100 employees; **separation rates** indicate the average number dropped from a payroll per 100 employees. Although month-to-month changes in employment can be calculated from the labor turnover data, the results are not comparable with employment data from the employment and payroll survey. The labor turnover survey measures changes during the calendar month while the employment and payroll survey measures changes from midmonth to midmonth.

Notes on the data

Establishment data collected by the Bureau of Labor Statistics are periodically adjusted to comprehensive counts of employment (called "benchmarks"). The latest complete adjustment was made with the release of June 1980 data, published in the August 1980 issue of the *Review*. Consequently, data published in the *Review* prior to that issue are not necessarily comparable to current data. Complete comparable historical unadjusted and seasonally adjusted data are published in a Supplement to Employment and Earnings (unadjusted data from April 1977 through March 1980 and seasonally adjusted data from January 1974 through March 1980) and in *Employment and Earnings, United States, 1909–78*, BLS Bulletin 1312–11 (for prior periods).

Data on recalls were shown for the first time in tables 12 and 13 in the January 1978 issue of the *Review*. For a detailed discussion of the recalls series, along with historical data, see "New Series on Recalls from the Labor Turnover Survey," *Employment and Earnings*, December 1977, pp. 10–19.

A comprehensive discussion of the differences between household and establishment data on employment appears in Gloria P. Green, "Comparing employment estimates from household and payroll surveys," *Monthly Labor Review*, December 1969, pp. 9–20. See also *BLS Handbook of Methods for Surveys and Studies*, Bulletin 1910 (Bureau of Labor Statistics, 1976).

The formulas used to construct the spendable average weekly earnings series reflect the latest provisions of the Federal income tax and social security tax laws. For the spendable average weekly earnings formulas for the years 1978–80, see *Employment and Earnings*, March 1980, pp. 10–11. Real earnings data are adjusted using the Consumer Price Index for Urban Wage Earners and Clerical Workers (CPI-W).

NOTE: The earnings expressed in 1967 dollars have been adjusted for changes in price level as measured by the Bureau's Consumer Price Index for Urban Wage Earners and Clerical Workers. These series are described in "The Spendable Earnings Series: A Technical Note on its Calculation," Employment and Earnings and Monthly Report on the Labor Force, February 1969, pp. 6–13. See also "Spendable Earnings Formulas, 1978–80," Employment and Earnings, March 1980, pp. 10–11.

UNEMPLOYMENT INSURANCE DATA

UNEMPLOYMENT INSURANCE DATA are compiled monthly by the Employment and Training Administration of the U.S. Department of Labor from records of State and Federal unemployment insurance claims filed and benefits paid. Railroad unemployment insurance data are prepared by the U.S. Railroad Retirement Board.

Definitions

Data for **all programs** represent an unduplicated count of insured unemployment under State programs, Unemployment Compensation for Ex-Servicemen, and Unemployment Compensation for Federal Employees, and the Railroad Insurance Act.

Under both State and Federal unemployment insurance programs for civilian employees, insured workers must report the completion of at least 1 week of unemployment before they are defined as unemployed. Persons not covered by unemployment insurance (about one-third of the labor force) and those who have exhausted or not yet earned benefit rights are excluded from the scope of the survey. **Initial claims** are notices filed by persons in unemployment insurance programs to indicate they are out of work and wish to begin receiving compensation. A claimant who continued to be unemployed a full week is then counted in the insured unemployment figure. The **rate of insured unemployment** expresses the number of insured unemployed as a percent of the average insured employment in a 12-month period.

An **application** for benefits is filed by a railroad worker at the beginning of his first period of unemployment in a benefit year; no application is required for subsequent periods in the same year. **Number of payments** are payments made in 14-day registration periods. The **average amount of benefit payment** is an average for all compensable periods, not adjusted for recovery of overpayments or settlement of underpayments. However, **total benefits** paid have been adjusted.

21. Unemployment insurance and employment service operations

[1] Initial claims and State insured unemployment include data under the program for Puerto Rican sugarcane workers.

[2] Includes interstate claims for the Virgin Islands. Excludes transition claims under State programs.

[3] Excludes data on claims and payments made jointly with other programs.

[4] Includes the Virgin Islands. Exludes data on claims and payments made jointly with State programs.

[5] Cumulative total for fiscal year (October 1 - September 30).

NOTE: Data for Puerto Rico included. Dashes indicate data not available.

PRICE DATA

PRICE DATA are gathered by the Bureau of Labor Statistics from retail and primary markets in the United States. Price indexes are given in relation to a base period (1967 = 100, unless otherwise noted).

Definitions

The **Consumer Price Index** is a monthly statistical measure of the average change in prices in a fixed market basket of goods and services. Effective with the January 1978 index, the Bureau of Labor Statistics began publishing CPI's for two groups of the population. One index, a new CPI for All Urban Consumers, covers 80 percent of the total noninstitutional population; and the other index, a revised CPI for Urban Wage Earners and Clerical Workers, covers about half the new index population. The All Urban Consumers index includes, in addition to wage earners and clerical workers, professional, managerial, and technical workers, the self-employed, short-term workers, the unemployed, retirees, and others not in the labor force.

The CPI is based on prices of food, clothing, shelter, fuel, drugs, transportation fares, doctor's and dentist's fees, and other goods and services that people buy for day-to-day living. The quantity and quality of these items is kept essentially unchanged between major revisions so that only price changes will be measured. Prices are collected from over 18,000 tenants, 24,000 retail establishments, and 18,000 housing units for property taxes in 85 urban areas across the country. All taxes directly associated with the purchase and use of items are included in the index. Because the CPI's are based on the expenditures of two population groups in 1972–73, they may not accurately reflect the experience of individual families and single persons with different buying habits.

Though the CPI is often called the "Cost-of-Living Index," it measures only price change, which is just one of several important factors affecting living costs. Area indexes do not measure differences in the level of prices among cities. They only measure the average change in prices for each area since the base period.

Producer Price Indexes measure average changes in prices received in primary markets of the United States by producers of commodities in all stages of processing. The sample used for calculating these indexes contains about 2,800 commodities and about 10,000 quotations per month selected to represent the movement of prices of all commodities produced in the manufacturing, agriculture, forestry, fishing, mining, gas and electricity, and public utilities sectors. The universe includes all commodities produced or imported for sale in commercial transactions in primary markets in the United States.

Producer Price Indexes can be organized by stage of processing or by commodity. The stage of processing structure organizes products by degree of fabrication (that is, finished goods, intermediate or semifinished goods, and crude materials). The commodity structure organizes products by similarity of end-use or material composition.

To the extent possible, prices used in calculating Producer Price Indexes apply to the first significant commercial transaction in the United States, from the production or central marketing point. Price data are generally collected monthly, primarily by mail questionnaire. Most prices are obtained directly from producing companies on a voluntary and confidential basis. Prices generally are reported for the Tuesday of the week containing the 13th day of the month.

In calculating Producer Price Indexes, price changes for the various commodities are averaged together with implicit quantity weights representing their importance in the total net selling value of all commodities as of 1972. The detailed data are aggregated to obtain indexes for stage of processing groupings, commodity groupings, durability of product groupings, and a number of special composite groupings.

Price indexes for the output of selected SIC industries measure average price changes in commodities produced by particular industries, as defined in the *Standard Industrial Classification Manual 1972* (Washington, U.S. Office of Management and Budget, 1972). These indexes are derived from several price series, combined to match the economic activity of the specified industry and weighted by the value of shipments in the industry. They use data from comprehensive industrial censuses conducted by the U.S. Bureau of the Census and the U.S. Department of Agriculture.

Notes on the data

Beginning with the May 1978 issue of the *Review*, regional CPI's cross classified by population size, were introduced. These indexes will enable users in local areas for which an index is not published to get a better approximation of the CPI for their area by using the appropriate population size class measure for their region. The cross-classified indexes will be published bimonthly. (See table 24.)

For further details about the new and the revised indexes and a comparison of various aspects of these indexes with the old unrevised CPI, see *Facts About the Revised Consumer Price Index*, a pamphlet in the Consumer Price Index Revision 1978 series. See also *The Consumer Price Index: Concepts and Content Over the Years*. Report 517, revised edition (Bureau of Labor Statistics, May 1978).

For interarea comparisons of living costs at three hypothetical standards of living, see the family budget data published in the *Handbook of Labor Statistics, 1977*, Bulletin 1966 (Bureau of Labor Statistics, 1977), tables 122–133. Additional data and analysis on price changes are provided in the *CPI Detailed Report* and *Producer Prices and Price Indexes*, both monthly publications of the Bureau.

As of January 1976, the Wholesale Price Index (as it was then called) incorporated a revised weighting structure reflecting 1972 values of shipments. From January 1967 through December 1975, 1963 values of shipments were used as weights.

For a discussion of the general method of computing consumer, producer, and industry price indexes, see *BLS Handbook of Methods for Surveys and Studies*, Bulletin 1910 (Bureau of Labor Statistics, 1976), chapters 13–15. See also John F. Early, "Improving the measurement of producer price change," *Monthly Labor Review*, April 1978, pp. 7–15. For industry prices, see also Bennett R. Moss, "Industry and Sector Price Indexes," *Monthly Labor Review*, August 1965, pp. 974–82.

[1] Data for June 1980 have been revised to reflect the availability of late reports and corrections by respondents. All data are subject to revision 4 months after original publication.

[2] Prices for natural gas are lagged 1 month.

[3] Includes only domestic production.

[4] Most prices for refined petroleum products are lagged 1 month.

[5] Some prices for industrial chemicals are lagged 1 month.

r = revised.

28. Producer Price Indexes, for special commodity groupings

[1967=100 unless otherwise specified]

Commodity grouping	Annual average 1979	1979			1980									
		Oct.	Nov.	Dec.	Jan.	Feb.	Mar.	Apr.	May	June [1]	July	Aug.	Sept.	Oct.
All commodities — less farm products	234.4	245.3	247.0	249.5	256.7	260.9	262.8	264.8	265.9	r267.5	270.3	273.0	273.9	277.3

[1] Data for June 1980 have been revised to reflect the availability of late reports and corrections by respondents. All data are subject to revision 4 months after original publication.

r = revised.

PRODUCTIVITY DATA

PRODUCTIVITY DATA are compiled by the Bureau of Labor Statistics from establishment data and from estimates of compensation and output supplied by the U.S. Department of Commerce and the Federal Reserve Board.

Definitions

Output is the constant dollar gross domestic product produced in a given period. Indexes of **output per hour of labor input,** or labor productivity, measure the value of goods and services produced per hour of labor. **Compensation per hour** includes wages and salaries of employees plus employers' contributions for social insurance and private benefit plans. The data also include an estimate of wages, salaries, and supplementary payments for the self-employed, except for nonfinancial corporations, in which there are no self-employed. **Real compensation per hour** is compensation per hour adjusted by the Consumer Price Index for All Urban Consumers.

Unit labor cost measures the labor compensation cost required to produce one unit of output and is derived by dividing compensation by output. **Unit nonlabor payments** include profits, depreciation, interest, and indirect taxes per unit of output. They are computed by subtracting compensation of all persons from the current dollar gross domestic product and dividing by output. In these tables, **Unit nonlabor costs** contain all the components of unit nonlabor payments except unit profits. **Unit profits** include corporate profits and inventory valuation adjustments per unit of output.

The **implicit price deflator** is derived by dividing the current dollar estimate of gross product by the constant dollar estimate, making the deflator, in effect, a price index for gross product of the sector reported.

The use of the term "man-hours" to identify the labor component of productivity and costs, in tables 31 through 34, has been discontinued. **Hours of all persons** is now used to describe the labor input of payroll workers, self-employed persons, and unpaid family workers. **Output per all-employee hour** is now used to describe labor productivity in nonfinancial corporations where there are no self-employed.

Notes on the data

In the private business sector and the nonfarm business sector, the basis for the output measure employed in the computation of output per hour is Gross Domestic Product rather than Gross National Product. Computation of hours includes estimates of nonfarm and farm proprietor hours.

Output data are supplied by the Bureau of Economic Analysis, U.S. Department of Commerce, and the Federal Reserve Board. Quarterly manufacturing output indexes are adjusted by the Bureau of Labor Statistics to annual estimates of output (gross product originating) from the Bureau of Economic Analysis. Compensation and hours data are from the Bureau of Economic Analysis and the Bureau of Labor Statistics.

Beginning with the September 1976 issue of the *Review*, tables 31–34 were revised to reflect changeover to the new series—private business sector and nonfarm business sector—which differ from the previously published total private economy and nonfarm sector in that output imputed for owner-occupied dwellings and the household and institutions sectors, as well as the statistical discrepancy, are omitted. For a detailed explanation, see J. R. Norsworthy and L. J. Fulco, "New sector definitions for productivity series," *Monthly Labor Review*, October 1976, pages 40–42.

31. Annual indexes of productivity, hourly compensation, unit costs, and prices, 1950–79

LABOR-MANAGEMENT DATA

MAJOR COLLECTIVE BARGAINING DATA are obtained from contracts on file at the Bureau of Labor Statistics, direct contact with the parties, and from secondary sources. Additional detail is published in *Current Wage Developments*, a monthly periodical of the Bureau. Data on work stoppages are based on confidential responses to questionnaires mailed by the Bureau of Labor Statistics to parties involved in work stoppages. Stoppages initially come to the attention of the Bureau from reports of Federal and State mediation agencies, newspapers, and union and industry publications.

Definitions

Data on wage changes apply to private nonfarm industry agreements covering 1,000 workers or more. Data on wage and benefit changes *combined* apply only to those agreements covering 5,000 workers or more. **First-year wage settlements** refer to pay changes going into effect within the first 12 months after the effective date of the agreement. **Changes over the life of the agreement** refer to total agreed upon settlements (exclusive of potential cost-of-living escalator adjustments) expressed at an average annual rate. **Wage-rate changes** are expressed as a percent of straight-time hourly earnings, while **wage and benefit changes** are expressed as a percent of total compensation.

Effective wage-rate adjustments going into effect in major bargaining units measure changes actually placed into effect during the reference period, whether the result of a newly negotiated increase, a deferred increase negotiated in an earlier year, or as a result of a cost-of-living escalator adjustment. Average adjustments are affected by workers receiving no adjustment, as well as by those receiving increases or decreases.

Work stoppages include all known strikes or lockouts involving six workers or more and lasting a full shift or longer. Data cover all workers idle one shift or more in establishments directly involved in a stoppage. They do not measure the indirect or secondary effect on other establishments whose employees are idle owing to material or service shortages.

35. Wage and benefit settlements in major collective bargaining units, 1975 to date

[In percent]

Sector and measure	Annual average					Quarterly average

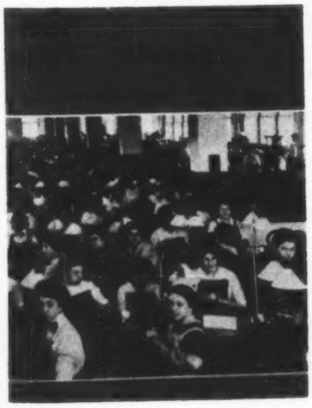
MONTHLY LABOR REVIEW

Index of Volume 103
January 1980 through December 1980



IMMIGRATION

INDEX OF VOLUME 103

JANUARY 1980 THROUGH DECEMBER 1980

ACCIDENTS (See Work injuries and illnesses.)

AFL-CIO

Meany farewell, bid to Auto Workers, Teamsters mark AFL-CIO convention. 1980 Feb. 58–62.

AGE DISCRIMINATION IN EMPLOYMENT ACT OF 1967 (ADEA)

Age Discrimination in Employment Act: a review of recent changes. 1980 Mar. 32–36.

The retirement decision: a question of opportunity? 1980 Nov. 14–17.

AID TO FAMILIES WITH DEPENDENT CHILDREN (AFDC)

New directions for income transfer programs. 1980 Feb. 41–45.

ALCOHOLISM

The extent of alcoholism among Air Force employees. 1980 May 46–49.

APPRENTICESHIP (See Education and training.)

ARBITRATION

Arbitration and the rights of mentally handicapped workers. 1980 Apr. 41–42.

Customized 'final-offer': New Jersey's arbitration law. 1980 Sept. 30–33.

Do uncertain cost/benefit estimates prolong public-sector disputes? 1980 Sept. 26–29.

Industrial relations research: an agenda for the 1980's. 1980 Sept. 20–25.

AUTOMATION (See Technological change.)

BARGAINING (See Collective bargaining.)

BENEFITS (See Supplemental benefits.)

BUDGETS

Family budget increases in 1978 were the largest in 4 years. 1980 Jan. 44–47.

Special panel suggests changes in BLS family budget program. 1980 Dec. 3–10.

Rise in autumn 1979 family budgets marked by transportation and taxes. 1980 Aug. 29–30.

BUREAU OF LABOR STATISTICS

Frances Perkins, Isador Lubin, and the Bureau of Labor Statistics. 1980 Apr. 22–30.

CALIFORNIA

Short-time compensation systems in California and Europe. 1980 July 13–22.

CANADA

Educational leave in Canada: a look at individual programs. 1980 Aug. 41–43.

CHILD CARE

Child care and family benefits: policies of six industrialized countries. 1980 Nov. 23–28.

CHILD LABOR

Exploitation of children widespread, ILO reports. 1980 Nov. 43–45.

CIVIL SERVANTS (See Public employees.)

COLLECTIVE BARGAINING

Arbitration and the rights of mentally handicapped workers. 1980 Apr. 41–47.

Collective bargaining in the health care industry. 1980 Feb. 49–53.

Contracts in six key industries scheduled to expire in 1981. 1980 Dec. 22–31.

Do uncertain cost/benefit estimates prolong public-sector disputes? 1980 Sept. 26–29.

Hospital managers' perception of the impact of unionization. 1980 June 36–38.

Industrial relations in 1979: inflation still holds spotlight. 1980 Feb. 11–18.

Industrial relations research: an agenda for the 1980's. 1980 Sept. 20–25.

Labor and the Supreme Court: significant decisions of 1978–79. 1980 Jan. 14–21.

Labor-management panels: three case studies. 1980 June 41–44.

Scheduled wage increases and escalator provisions in 1980. 1980 Jan. 9–13.

Two approaches to the mediator's role. 1980 June 39–40.

Unionism's effect on faculty pay: handicapping the available data. 1980 June 34–36.

Wage gains in 1979 offset by inflation. 1980 July 48–51.

COMPREHENSIVE EMPLOYMENT AND TRAINING ACT (CETA)

Geographic wage indexing for CETA and Medicare. 1980 Sept. 15–19.

CONFERENCES AND CONVENTIONS

AFL-CIO. 13th biennial convention, November 1979. 1980 Feb. 58–62.

Industrial Relations Research Association. 32d annual meeting, December 1979. Papers from. 1980 June 32–40; July 37–39, 41–43; Aug. 22–28.

International Labor Organization, 66th session, June 1980. 1980 Nov. 39–43.

United Automobile, Aerospace and Agricultural Implement Workers of America. 26th constitutional convention, June 1980. 1980 Sept. 41–43.

United Mine Workers of America. Triennial convention, December 1979. 1980 Mar. 48–50.

Work in America Institute and the International Institute of Labor Studies Conference, December 1979. Paper from. 1980 July 39–41.

CONSTRUCTION

Does the CPI exaggerate or understate inflation? 1980 May 31–33.

Does the CPI exaggerate or understate inflation? Some observations. 1980 May 33–35.

Double-digit inflation today and in 1973–74: a comparison. 1980 May 3–20.

Estimating the user cost of owner-occupied housing. 1980 Feb. 31–35.

Measuring the social costs of instability in construction. 1980 Feb. 53–57.

CONSUMER PRICE INDEX (See also Prices.)
CPI controversy. 1980 Feb. 2.
Does the CPI exaggerate or understate inflation? 1980 May 31–33.
Does the CPI exaggerate or understate inflation? Some observations. 1980 May 33–35.
Estimating the user cost of owner-occupied housing. 1980 Feb. 31–35.
Inflation slows in third quarter, although food prices soar. 1980 Dec. 45–51.
The Consumer Price Index and indexation. 1980 June 2.

COST OF LIVING
Cost-of-Living indexes for Americans living abroad. 1980 Jan. 53–54; June 50; Sept. 40.
Family budget increases in 1978 were the largest in 4 years. 1980 Jan. 44–47.
Special panel suggests changes in BLS family budget program. 1980 Dec. 3–10.
Rise in autumn 1979 family budgets marked by transportation and taxes. 1980 Aug. 29–30.
The Consumer Price Index and indexation. 1980 June 2.

DECISIONS, COURT (See also Labor and the Supreme Court: significant decisions of 1978–79.) 1980 Jan. 14–21.

Administrative Procedures Act
Marshall v. Jerrico, Inc. 1980 June 52.

Civil Service Retirement Act
U.S. v. Clark. 1980 June 53.

Civil Rights Act of 1964
Alexander v. Gardner-Denver Co. 1980 Dec. 63.
Board of Education, City of New York v. Harris. 1980 Mar. 52.
California Brewers Assn. v. Bryant. 1980 June 51.
Dist. Atty. Sacramento City v. Sacramento City. Civil Service Commission. 1980 Dec. 63–64.
General Telephone Co. v. EEOC. 1980 Aug. 45–46.
Steelworkers v. Weber. 1980 June 51 and Dec. 63–64.
Teamsters v. U.S. 1980 June 51.
Univ. of Calif. Regents v. Bakke. 1980 Sept. 54–56.

Constitutional issues
Branti v. Finkel. 1980 Aug. 44–45.
Califano v. Goldfarb. 1980 Aug. 45.
Detroit Police Officers' Assn. v. Young. 1980 Dec. 63–64.
Elrod v. Burns. 1980 Aug. 44–45.
Fullilove v. Klutznick. 1980 Sept. 54–56 and Dec. 63–64.
Los Angeles City v. Marshall. 1980 Dec. 64.
Maehren v. City of Seattle. 1980 Dec. 64.
Marshall v. Jerrico, Inc. 1980 June 52.
Nachman Corp. v. Pension Benefit Guaranty Corp. 1980 Sept. 56.
NLRB v. Retail Store Employees Union. 1980 Nov. 47.
National League of Cities v. Usery. 1980 Dec. 64.
New Hampshire Dept. of Employment Security v. Marshall. 1980 Dec. 64.
Steelworkers v. Weber. 1980 Dec. 63–64.
Tumey v. Ohio. 1980 June 52.
U.S. v. Clark. 1980 June 53.
Univ. of Calif. Regents v. Bakke. 1980 Sept. 55.
Ward v. Village of Monroeville. 1980 June 52.
Weinberger v. Wisenfield. 1980 Aug. 45.
Wengler v. Druggists Mutual Ins. Co. 1980 Aug. 45.

Emergency School Aid Act
Board of Education, City of New York v. Harris. 1980 Mar. 52.

Employee Retirement Income Security Act of 1974
Nachman Corp. v. Pension Benefit Guaranty Corp. 1980 Sept. 56.

Fair Labor Standards Act
Barrentine v. Arkansas-Best Freight System, Inc. 1980 Dec. 63.
Marshall v. Jerrico, Inc. 1980 June 52.

Federal Employers' Liability Act
Norfolk and Western Railway Co. v. Liepelt. 1980 June 52.

Federal Mine Safety and Health Act Amendments of 1977
Whirlpool Corp. v. Marshall. 1980 Apr. 57.

Federal Rules of Civil Procedure
General Telephone Co. v. EEOC. 1980 Aug. 45–46.

Labor-Management Relations Act
Carbon Fuel Co. v. United Mine Workers of America. 1980 Mar. 51.
Whirlpool Corp. v. Marshall. 1980 Apr. 57.

Longshoremen's and Harbor Workers' Compensation Act
Nacirema Operating Co. v. Johnson. 1980 Mar. 51.

NLRB v. Fruit Packers (Tree Fruits). 1980 Nov. 47.
NLRB v. International Longshoremen's Association. 1980 Nov. 46.
NLRB v. Yeshiva University. 1980 Apr. 57.
NLRB v. Retail Store Employees Union. 1980 Nov. 47.
Steelworkers Trilogy. 1980 Mar. 51.
Whirlpool Corp. v. Marshall. 1980 Apr. 57.

Occupational Safety and Health Act of 1970
American Iron and Steel Institute v. OSHA. 1980 Dec. 63.
American Textile Mfg. Assn., Inc. v. Marshall. 1980 Dec. 63.
Industrial Union Dept., AFL-CIO v. American Petroleum Institute. 1980 Sept. 53–54 and Dec. 63.
Marshall v. Certified Welding Co. 1980 Apr. 57.
Marshall v. Daniel Construction Co. 1980 Apr. 57.
Whirlpool Corp. v. Marshall. 1980 Apr. 57.

Public Works Employment Act of 1977
Fullilove v. Klutznick. 1980 Sept. 54–56.

Social Security Act
Califano v. Goldfarb. 1980 Aug. 45.
Weinberger v. Wisenfield. 1980 Aug. 45.
Wengler v. Druggists Mutual Ins. Co. 1980 Aug. 45.

State laws
Dist. Atty. Sacramento City v. Sacramento City. Civil Service Commission. 1980 Dec. 63.
National League of Cities v. Usery. 1980 Dec. 64.
New Hampshire Dept. of Employment Security v. Marshall. 1980 Dec. 64.
Los Angeles City. v. Marshall. 1980 Dec. 64.
Wengler v. Druggists Mutual Ins. Co. 1980 Aug. 45.

Vietnam Era Veterans' Readjustment Assistance Act of 1974
Alabama Power Co. v. Davis. 1980 Nov. 48.
Coffey v. Republic Steel Corp. 1980 Nov. 48.

DISABILITY
How the disabled fare in the labor market. 1980 Sept. 48–52.

DISCOURAGED WORKERS
National Commission recommends changes in labor force statistics. 1980 Apr. 11–21.

DISCRIMINATION (See Equal Employment Opportunity.)
DISPLACED WORKERS
Auto Workers seek Government aid for laid-off workers, ailing industry. 1980 Sept. 41–43.

DOMESTIC WORKERS
Women in domestic work: yesterday and today. 1980 Aug. 17–21.

EARNINGS AND WAGES

General

Employment and pay trends in the retail trade industry. 1980 Mar. 40–43.
Geographic wage indexing for CETA and Medicare. 1980 Sept. 15–19.
Hours and earnings of production or nonsupervisory workers, 1968–78. 1980 Apr. 54–56.
How the disabled fare in the labor market. 1980 Sept. 48–52.
Immigrant earnings patterns by sex, race, and ethnic groupings. 1980 Oct. 22–25.
Industrial relations in 1979: inflation still holds spotlight. 1980 Feb. 11–18.
Industrial relations research: an agenda for the 1980's. 1980 Sept. 20–25.
Measuring wage relationships among selected occupations. 1980 May 21–25.
Percent working long hours shows first post-recession decline. 1980 May 39–42.
Scheduled wage increases and escalator provisions in 1980. 1980 Jan. 9–13.
Self-employed Americans: their number has increased. 1980 Nov. 3–8.
State labor legislation enacted in 1979. 1980 Jan. 22–39.
The Consumer Price Index and indexation. 1980 June 2.
The distribution of earned income among men and women, 1958–77. 1980 Apr. 3–10.
Tracking individual earnings mobility with the Current Population Survey. 1980 May 43–46.
Unionism's effect on faculty pay: handicapping the available data. 1980 June 34–36.
Wage and benefits of State and local government employees. 1980 Sept. 2.
Wage gains in 1979 offset by inflation. 1980 July 48–51.
Working wives reduce inequality in distribution of family earnings. 1980 July 51–53.

Specified industries and occupations

Auto dealer repair shops, June 1978. 1980 Apr. 56.
Building trades, July 1978–79. 1980 Dec. 61.
Communications, 1978. 1980 Nov. 37–38.
Electric and gas utilities, February 1978. 1980 Dec. 59–60.
Hotels and motels, May 1978. 1980 Dec. 60–61.
Men's apparel, May 1978. 1980 Jan. 52–53.
Printing industry, September 1978. 1980 Nov. 36–37.
Printing trades, July 1976–77. 1980 Jan. 54.
Steel mills, February 1978-May 1980. 1980 Dec. 62.
White-collar workers, March 1980. 1980 Nov. 33–34.

ECONOMIC POLICIES AND PROGRAMS

Beyond Keynes: European unions formulate new economic programs. 1980 Feb. 36–40.
Moving to the sun: regional job growth, 1968 to 1978. 1980 Mar. 12–19.

EDUCATION AND TRAINING

Educational leave in Canada: a look at individual programs. 1980 Aug. 41–43.
Employment training in France: firm and worker experience. 1980 June 45–50.
School and work among youth during the 1970's. 1980 Sept. 44–47.
State labor legislation enacted in 1979. 1980 Jan. 22–39.
Trends in educational attainment among workers in the 1980's. 1980 July 44–47.

EMPLOYMENT

Are women safer workers? a new look at the data. 1980 Sept. 3–10.
Employment and pay trends in the retail trade industry. 1980 Mar. 40–43.
Employment and unemployment during 1979: an analysis. 1980 Feb. 3–10.
Employment and unemployment in the first half of 1980. 1980 Aug. 3–9.
Employment gains of women by industry, 1968–78. 1980 June 3–9.
Employment patterns of Southeast Asian refugees. 1980 Oct. 31–38.
Employment training in France: firm and worker experience. 1980 June 45–50.
Evaluating the 1975 projections of occupational employment. 1980 June 10–21.
Folding paperboard box industry shows slow rise in productivity. 1980 Mar. 25–28.
Identifying States and areas prone to high and low unemployment. 1980 Mar. 20–24.
Immigration and employment: a need for policy coordination. 1980 Oct. 47–50.
Labor force activity of married women as a response to changing jobless rates. 1980 June 32–33.
Measuring the social costs of instability in construction. 1980 Feb. 53–57.
Minorities report. 1980 Mar. 2.
Moving to the sun: regional job growth, 1968 to 1978. 1980 Mar. 12–19.
National Commission recommends changes in labor force statistics. 1980 Apr. 11–21.
Productivity growth below average in fabricated structural metals. 1980 June 27–31.
Recent trends in worktime: hours edge downward. 1980 Mar. 3–11.
School and work among youth during the 1970's. 1980 Sept. 44–47.
Seasonal variations in employment and unemployment during 1951–75. 1980 Jan. 48–52.
Self-employed Americans: their number has increased. 1980 Nov. 3–8.
The labor force experience of black youth: a review. 1980 Aug. 10–16.
The workweek in 1979: fewer but longer workdays. 1980 Aug. 31–33.
Tracking individual earnings mobility with the Current Population Survey. 1980 May 43–46.
Trends in educational attainment among workers in the 1980's. 1980 July 44–47.
U.S. labor turnover: analysis of a new measure. 1980 Nov. 9–13.
Women in domestic work: yesterday and today. 1980 Aug. 17–21.
Women's use of time converging with men's. 1980 Dec. 57–59.
Work experience of the population in 1978. 1980 Mar. 43–47.
Worksharing in the U.S.: its prevalence and duration. 1980 July 3–12.

ENERGY

Double-digit inflation today and in 1973–74: a comparison. 1980 May 3–20.
Slowdown in energy prices eases second-quarter inflation. 1980 Sept. 34–40.

EQUAL EMPLOYMENT OPPORTUNITY

Employment gains of women by industry, 1968–78. 1980 June 3–9.
Industrial relations in 1979: inflation still holds spotlight. 1980 Feb. 11–18.
Labor and the Supreme Court: significant decisions of 1978–79. 1980 Jan. 14–21.
State labor legislation enacted in 1979. 1980 Jan. 22–39.
The distribution of earned income among men and women, 1958–77. 1980 Apr. 3–10.

ESCALATOR CLAUSES

Scheduled wage increases and escalator provisions in 1980. 1980 Jan. 9–13.

EUROPE

American wood products workers study European job safety systems. 1980 Aug. 40–41.
Beyond Keynes: European unions formulate new economic program. 1980 Feb. 36–40.
Short-time compensation systems in California and Europe. 1980 July 13–22.

FEDERAL EMPLOYEES (See Public employees.)
FEDERAL REPUBLIC OF GERMANY

Child care and family benefits: policies of six industrialized countries. 1980 Nov. 23–28.

FLEXITIME

Results of experimental study on flexitime and family life. 1980 Nov. 29–32.

FRANCE

Child care and family benefits: policies of six industrialized countries. 1980 Nov. 23–28.
Employment training in France: firm and worker experience. 1980 June 45–50.

FRINGE BENEFITS (See Supplemental benefits.)
GERMAN DEMOCRATIC REPUBLIC

Child care and family benefits: policies of six industrialized countries. 1980 Nov. 23–28.

GOVERNMENT WORKERS (See Public employees.)
HEALTH AND SAFETY

American wood products workers study European job safety systems. 1980 Aug. 40–41.
Arbitration and the rights of mentally handicapped workers. 1980 Apr. 41–47.
Are women safer workers? a new look at the data. 1980 Sept. 3–10.
A view of the costs and benefits of the job safety and health law. 1980 Aug. 24–26.
Collective bargaining in the health care industry. 1980 Feb. 49–52.

Exploitation of children widespread, ILO reports. 1980 Nov. 43–45.
Industrial relations in 1979: inflation still holds spotlight. 1980 Feb. 11–18.
Occupational diseases. 1980 Aug. 2.
Occupational safety and health: a report on worker perceptions. 1980 Sept. 11–14.
State labor legislation enacted in 1979. 1980 Jan. 22–39.
Targeting worker safety programs: weighing incidence against expense. 1980 Jan. 3–8.
The extent of alcoholism among Air Force employees. 1980 May 46–49.
The sounds of silence: little aid awarded for job-related hearing loss. 1980 Nov. 35–36.
Vinyl chloride protection: less costly than predicted. 1980 Aug. 22–24.

HOURS OF WORK

Conflicts among work, leisure, and family roles. 1980 Aug. 35–39.
Conflicts between work and family life. 1980 Mar. 29–31.
Hours and earnings of production or nonsupervisory workers, 1968–78. 1980 Apr. 54–56.
Percent working long hours shows first post-recession decline. 1980 May 39–42.
Recent trends in worktime: hours edge downward. 1980 Mar. 3–11.
Results of experimental study on flexitime and family life. 1980 Nov. 29–32.
Self-employed Americans: their number has increased. 1980 Nov. 3–8.
State labor legislation enacted in 1979: 1980 Jan. 22–39.
The workweek in 1979: fewer but longer workdays. 1980 Aug. 31–33.
Women's use of time converging with men's. 1980 Dec. 57–59.
Worksharing in the U.S.: its prevalence and duration. 1980 July 3–12.

HOUSING (See Construction.)
HUNGARY

Child care and family benefits: policies of six industrialized countries. 1980 Nov. 23–28.

IMMIGRATION

Immigration and the labor force—A special issue. 1980 Oct. 4–50.
International migration of labor: boon or bane?
The changing composition of Europe's guestworker population.
Documenting the undocumented: data, like aliens, are elusive.
Immigrant earnings patterns by sex, race, and ethnic groupings.
Nonimmigrant workers: visiting labor force participants.
Employment patterns of Southeast Asian refugees.
The new Cuban immigrants: their background and prospects.
Immigration and employment: a need for policy coordination.

INCOME (See Earnings and wages.)
INDEXES

Cost-of-living indexes for Americans living abroad. 1980 Jan. 53–54 June 50; Sept. 40.
CPI controversy. 1980 Feb. 2.
Estimating the user cost of owner-occupied housing. 1980 Feb. 31–35.
Geographic wage indexing for CETA and Medicare. 1980 Sept. 15–19.
The Consumer Price Index and indexation. 1980 June 2.

INDUSTRIAL RELATIONS (See Labor-management relations.)
INFLATION

Does the CPI exaggerate or understate inflation? 1980 May 31–33.
Does the CPI exaggerate or understate inflation? Some observations. 1980 May 33–35.
Double-digit inflation today and in 1973–74: a comparison. 1980 May 3–20.
Industrial relations in 1979: inflation still holds spotlight. 1980 Feb. 11–18.
Inflation slows in third quarter, although food prices soar. 1980 Dec. 45–51.
Slowdown in energy prices eases second-quarter inflation. 1980 Sept. 34–40.
Wage gains in 1979 offset by inflation. 1980 July 48–51.

INTERNATIONAL LABOR ORGANIZATION

Exploitation of children widespread, ILO reports. 1980 Nov. 43–45.
Highlights of the 1980 ILO conference. 1980 Nov. 39–43.
U.S. rejoins ILO: the agenda for 1980's stresses human rights. 1980 May 50–51.

JOB SATISFACTION

Conflicts among work, leisure, and family roles. 1980 Aug. 35–39.
How quality-of-worklife projects work for General Motors. 1980 July 37–39.
How quality-of-worklife projects work for the United Auto Workers. 1980 July 39–40.
The quality-of-worklife project at Bolivar: an assessment. 1980 July 41–43.

JOBSEEKING METHODS

Most workers find jobs through word of mouth. 1980 Aug. 33–35.

JOB SECURITY

Workers' expectations about losing and replacing their jobs. 1980 Apr. 53–54.

JOB TENURE

Employment and pay trends in the retail trade industry. 1980 Mar. 40–43.
Workers' expectations about losing and replacing their jobs. 1980 Apr. 53–54.

LABOR AND ECONOMIC HISTORY

Frances Perkins. 1980 Apr. 2.
Frances Perkins' interest in a new deal for blacks. 1980 Apr. 31–35.
Frances Perkins, Isador Lubin, and the Bureau of Labor Statistics. 1980 Apr. 22–30.

LABOR COSTS (See Unit labor cost.)

LABOR FORCE

Employment and unemployment during 1979: an analysis. 1980 Feb. 3–10.
Employment and unemployment in the first half of 1980. 1980 Aug. 3–9.
Employment gains of women by industry, 1968–78. 1980 June 3–9.
Evaluating the 1975 projections of occupational employment. 1980 June 10–21.
How the disabled fare in the labor market. 1980 Sept. 48–52.
Identifying States and areas prone to high and low unemployment. 1980 Mar. 20–24.
Immigration and the labor force—A special issue. 1980 Oct. 4–50.
    International migration of labor: boon or bane?
    The changing composition of Europe's guestworker population.
    Documenting the undocumented: data, like aliens, are elusive.
    Immigrant earnings patterns by sex, race, and ethnic groupings.
    Nonimmigrant workers: visiting labor force participants.
    Employment patterns of Southeast Asian refugees.
    The new Cuban immigrants: their background and prospects.
    Immigration and employment: a need for policy coordination.
Labor force activity of married women as a response to changing jobless rates. 1980 June 32–33.
Marital and family characteristics of the labor force, March 1979. 1980 Apr. 48–52.
Moving to the sun: regional job growth, 1965 to 1978. 1980 Mar. 12–19.
National Commission recommends changes in labor force statistics. 1980 Apr. 11–21.
New occupational rates of labor force separation. 1980 Mar. 36–40.
Percent working long hours shows first post-recession decline. 1980 May 39–42.
Probing the issues of unemployment duration. 1980 July 23–32.
School and work among youth during the 1970's. 1980 Sept. 44–47.
Seasonal variations in employment and unemployment during 1951–75. 1980 Jan. 48–52.
The distribution of earned income among men and women, 1958–77. 1980 Apr. 3–10.
The labor force experience of black youth: a review. 1980 Aug. 10–16.
The 1995 labor force: a first look. 1980 Dec. 11–21.
Tracking individual earnings mobility with the Current Population Survey. 1980 May 43–46.
Trends in educational attainment among workers in the 1980's. 1980 July 44–47.
U.S. labor turnover: analysis of a new measure. 1980 Nov. 9–13.
Women's share of moonlighting nearly doubles during 1969–79. 1980 May 36–39.
Workers' expectations about losing and replacing their jobs. 1980 Apr. 53–54.
Work experience of the population in 1978. 1980 Mar. 43–47.

LABOR LAW

Changes in unemployment insurance legislation during 1979. 1980 Apr. 36–40.
Labor and the Supreme Court: significant decisions of 1978–79. 1980 Jan. 14–21.
State labor legislation enacted in 1979. 1980 Jan. 22–39.
Workers' compensation laws—key amendments of 1979. 1980 Feb. 19–25.

LABOR-MANAGEMENT RELATIONS

Arbitration and the rights of mentally handicapped workers. 1980 Apr. 41–47.
Collective bargaining in the health care industry. 1980 Feb. 49–53.
Contracts in six key industries scheduled to expire in 1980. 1980 Dec. 22–31.
Customized 'final-offer': New Jersey's arbitration law. 1980 Sept. 30–33.
Do uncertain cost/benefit estimates prolong public-sector disputes? 1980 Sept. 26–29.
Hospital managers' perception of the impact of unionization. 1980 June 36–38.
How quality-of-worklife projects work for General Motors. 1980 July 37–39.
How quality-of-worklife projects work for the United Auto Workers. 1980 July 39–41.
Industrial relations research: an agenda for the 1980's. 1980 Sept. 20–25.
Labor and the Supreme Court: significant decisions of 1978–79. 1980 Jan. 14–21.
Labor-management panels: three case studies. 1980 June 41–44.
New Spanish legislation marks turning point in labor relations. 1980 Aug. 27–28.
Occupational safety and health: a report on worker perceptions. 1980 Sept. 11–14.
The quality-of-worklife project at Bolivar: an assessment. 1980 July 41–43.
Two approaches to the mediator's role. 1980 June 39–40.

LABOR MARKET

How the disabled fare in the labor market. 1980 Sept. 48–52.
Labor force activity of married women as a response to changing jobless rates. 1980 June 32–33.
National Commission recommends changes in labor force statistics. 1980 Apr. 11–21.
New occupational rates of labor force separation. 1980 Mar. 36–40.
Probing the issues of unemployment duration. 1980 July 23–32.
Self-employed Americans: their number has increased. 1980 Nov. 3–8.
The distribution of earned income among men and women, 1958–77. 1980 Apr. 3–10.
The labor force experience of black youth: a review. 1980 Aug. 10–16.

LABOR ORGANIZATIONS

Beyond Keynes: European unions formulate new economic program. 1980 Feb. 36–40.
Employment training in France: firm and worker experience. 1980 June 45–50.
Hospital managers' perception of the impact of unionization. 1980 June 36–38.
Labor-management panels: three case studies. 1980 June 41–44.
Meany farewell, bid to Auto Workers, Teamsters mark AFL-CIO convention. 1980 Feb. 58–62.
Mine Workers' new president wins dues increase, right to name VP. 1980 Mar. 48–50.
State of the unions. 1980 Jan. 2.
State labor legislation enacted in 1979. 1980 Jan. 22–39.
Two approaches to the mediator's role. 1980 June 39–40.
Unionism's effect on faculty pay: handicapping the available data. 1980 June 34–36.

LABOR REQUIREMENTS

Labor requirements decline for public housing construction. 1980 Dec. 40–44.

LABOR TURNOVER

U.S. labor turnover: analysis of a new measure. 1980 Nov. 9–13.

MEDICARE

Geographic wage indexing for CETA and Medicare. 1980 Sept. 15–19.

MIGRATION

Moving to the sun: regional job growth, 1968 to 1978. 1980 Mar. 12–19.

MINORITY WORKERS (See also Equal Employment Opportunity.)

Frances Perkins' interest in a new deal for blacks. 1980 Apr. 31–35.
Minorities report. 1980 Mar. 2.
The labor force experience of black youth: a review. 1980 Aug. 10–16.
The 1995 labor force: a first look. 1980 Dec. 11–21.

MULTIPLE JOBHOLDERS

Women's share of moonlighting nearly doubles during 1969–79. 1980 May 36–39.

OCCUPATIONAL SAFETY AND HEALTH ACT

A view of the costs and benefits of the job safety and health law. 1980 Aug. 24–26.
Vinyl chloride protection: less costly than predicted. 1980 Aug. 22–24.

OCCUPATIONS

Measuring wage relationships among selected occupations. 1980 May 21–25.

OLDER WORKERS

Age Discrimination in Employment Act: a review of recent changes. 1980 Mar. 32–35.
ILO meeting supported older workers, improved standards supervision. 1980 Nov. 39–43.
The 1995 labor force: a first look. 1980 Dec. 11–21.
The retirement decision: a question of opportunity? 1980 Nov. 14–17.

PENSIONS (See also Retirement; Supplemental benefits.)

Age Discrimination in Employment Act: a review of recent changes. 1980 Mar. 32–35.
Industrial relations in 1979: inflation still holds spotlight. 1980 Feb. 11–18.
Labor and the Supreme Court: significant decisions of 1978–79. 1980 Jan. 14–21.
Rise of pensions and social security created alternating goals for unions. 1980 Aug. 26–27.

POPULATION

Evaluating the 1975 projections of occupational employment. 1980 June 10–21.
National Commission recommends changes in labor force statistics. 1980 Apr. 11–27.
Work experience of the population in 1978. 1980 Mar. 43–47.

PRICES

CPI controversy. 1980 Feb. 2.
Does the CPI exaggerate or understate inflation? 1980 May 31–33.
Does the CPI exaggerate or understate inflation? Some observations. 1980 May 33–35.
Double-digit inflation today and in 1973–74: a comparison. 1980 May 3–20.
Inflation slows in third quarter, although food prices soar. 1980 Dec. 45–57.
Slowdown in energy prices eases second-quarter inflation. 1980 Sept. 34–40.
The Consumer Price Index and indexation. 1980 June 2.

PRODUCTIVITY

Construction machinery industry posts slow rise in productivity. 1980 July 33–36.
Folding paperboard box industry shows slow rise in productivity. 1980 Mar. 25–28.
International comparisons of productivity and labor costs. 1980 Dec. 32–39.
Productivity declines continue into third quarter 1979. 1980 Feb. 46–48.
Productivity gains in the drugstore industry, 1958–79. 1980 Nov. 18–22.
Productivity growth below average in fabricated structural metals. 1980 June 27–31.
Productivity increased in 1978 in most industries measured. 1980 Jan. 40–43.
Sixth consecutive productivity recorded for the second quarter. 1980 Dec. 52–54.
The paper and plastic bag industry: two distinct productivity phases. 1980 May 26–30.
The productivity trend in the soaps and detergents industry. 1980 Feb. 26–30.

PROJECTIONS

Evaluating the 1975 projections of occupational employment. 1980 June 10–21.
New occupational rates of labor force separation. 1980 Mar. 36–40.
The 1995 labor force: a first look. 1980 Dec. 11–21.

PUBLIC EMPLOYEES

Customized 'final-offer': New Jersey's arbitration law. 1980 Sept. 30–33.
Do uncertain cost/benefit estimates prolong public-sector disputes? 1980 Sept. 26–29.
Industrial relations in 1979: inflation still holds spotlight. 1980 Feb. 11–18.
Labor and the Supreme Court: significant decisions of 1978–79. 1980 Jan. 14–21.

QUALITY OF WORKLIFE

Conflicts among work, leisure, and family roles. 1980 Aug. 35–39.
How quality-of-worklife projects work for General Motors. 1980 July 37–39.
How quality-of-worklife projects work for the United Auto Workers. 1980 July 39–41.
Labor-management panels: three case studies. 1980 June 41–44.
Results of experimental study on flexitime and family life. 1980 Nov. 29–32.
The quality-of-worklife projects at Bolivar: an assessment. 1980 July 41–43.

RETIREMENT (See also Pensions.)

Age Discrimination in Employment Act: a review of recent changes. 1980 Mar. 32–35.
Rise of pensions and social security created alternating goals for unions. 1980 Aug. 26–27.
The retirement decision: a question of opportunity? 1980 Nov. 14–17.

SAFETY (See Health and safety.)

SALARIES (See Earnings and wages.)

SOCIAL SECURITY

Age Discrimination in Employment Act: a review of recent changes. 1980 Mar. 32–35.
New directions for income transfer programs. 1980 Feb. 41–45.
Occupational diseases. 1980 Aug. 2.
Rise of pensions and social security created alternating goals for unions. 1980 Aug. 26–27.

SPAIN

New Spanish legislation marks turning point in labor relations. 1980 Aug. 27–28.

SPECIAL LABOR FORCE REPORTS

Employment and unemployment during 1979: an analysis. 1980 Feb. 3–10.
Employment and unemployment in the first half of 1980. 1980 Aug. 3–9.
Marital and family characteristics of the labor force, March 1979. 1980 Apr. 48–52.
Percent working long hours shows first post-recession decline. 1980 May 29–42.
School and work among youth during the 1970's. 1980 Sept. 44–47.
Trends in educational attainment among workers in the 1980's. 1980 July 44–47.
Women's share of moonlighting nearly doubles during 1969–79. 1980 May 36–39.
Work experience of the population in 1978. 1980 Mar. 43–47.

STATE GOVERNMENT

Changes in unemployment insurance legislation during 1979. 1980 Apr. 36–40.
State labor legislation enacted in 1979. 1980 Jan. 22–39.
Wage and benefits of State and local government employees. 1980 Sept. 2.

STATISTICAL PROGRAMS AND METHODS

Evaluating the 1975 projections of occupational employment. 1980 June 10–21.
National Commission recommends changes in labor force statistics. 1980 Apr. 11–21.
New occupational rates of labor force separation. 1980 Mar. 36–40.
Probing the issues of unemployment duration. 1980 July 23–32.
Tracking individual earnings mobility with the Current Population Survey. 1980 May 43–46.
U.S. labor turnover: analysis of a new measure. 1980 Nov. 9–13.

STATISTICS

National Commission recommends changes in labor force statistics. 1980 Apr. 11–21.
Statistics in bureaucracies. 1980 Nov. 2.

SUPPLEMENTAL BENEFITS

Changes in unemployment insurance legislation during 1979. 1980 Apr. 36–40.
Child care and family benefits: policies of six industrialized countries. 1980 Nov. 23–28.
Dental and vision care benefits in health insurance plans. 1980 June 22–26.
Employee benefits. 1980 July 2.
Wage and benefits of State and local government employees. 1980 Sept. 2.
Wage gains in 1979 offset by inflation. 1980 July 48–51.
Workers' compensation laws—key amendments of 1979. 1980 Feb. 19–25.

SWEDEN

Child care and family benefits: policies of six industrialized countries. 1980 Nov. 23–28.

TECHNOLOGICAL CHANGE

Construction machinery industry posts slow rise in productivity. 1980 July 33–36.
Employment training in France: firm and worker experience. 1980 June 45–50.
Folding paperboard box industry shows slow rise in productivity. 1980 Mar. 25–28.
Productivity gains in the drugstore industry, 1958–79. 1980 Nov. 18–22.
Productivity growth below average in fabricated structural metals. 1980 June 27–31.
The paper and plastic bag industry: two distinct productivity phases. 1980 May 26–30.
The productivity trend in the soaps and detergents industry. 1980 Feb. 26–30.

TRADE READJUSTMENT ASSISTANCE

Auto Workers seek Government aid for laid-off workers, ailing industry. 1980 Sept. 41–43.

TRADE UNIONS (See Labor organizations.)
TRAINING (See Education and training.)
UNEMPLOYMENT (See also Employment; Labor force.)

Changes in unemployment insurance legislation during 1979. 1980 Apr. 36–40.

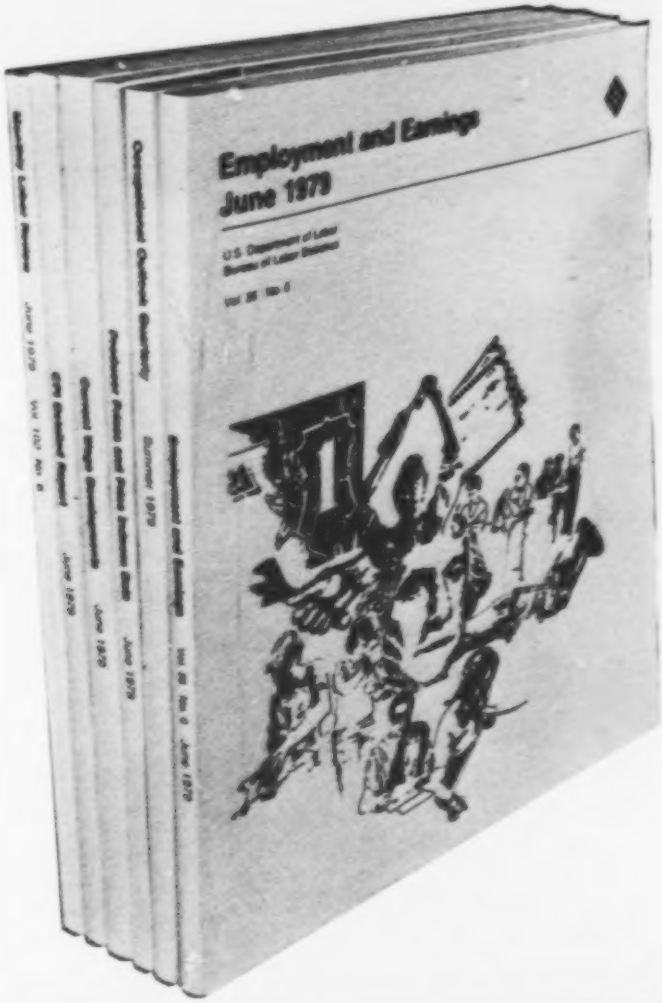
Employment and Earnings



Employment and Earnings
June 1979
U.S. Department of Labor
Bureau of Labor Statistics
Monthly Labor Review
Occupational Outlook Quarterly
Producer Prices and Price Indexes
Current Wage Developments
CPI Detailed Report
June 1979

. . . .one of six periodicals published by the Bureau of Labor Statistics, U.S. Department of Labor, gives monthly figures on *those two topics* for the Nation as a whole, for individual States, and for more than 200 areas. Included are household and establishment data, seasonally and not seasonally adjusted. The data are collected by the Bureau of the Census (Department of Commerce), State Employment Security Agencies, and State Departments of Labor in cooperation with BLS. A supplement is included in the subscription price.
